Sales and Accounts Training Manual

Sales Collections PTP DebiCheck and Queries

Version 3 • 9 October 2026

THE SALES JOURNEY

01 Login	02 Capture	03 Funnel	04 Application draft
05 ID + bank statement	06 Qualifying analysis	07 NuPay	08 Confirmed DebiCheck
09 Itensity activation	10 Contract + registration fee	11 Compliance complete	

Actual application screenshots • Synthetic training records

About this edition

This edition retains the Sales screenshot journey and adds detailed Collections, PTP, DebiCheck, Queries and notification guidance. Screens were captured from the running local application, not generated mock-ups. Bank analysis, approval, activation and payment examples were seeded locally for training; no real bank statements were analysed and no NuPay or Itensity transactions were sent.

Some screenshots use an admin account to show restricted controls. Consultants and managers must follow their assigned permissions. Only admins may explicitly override requirements; overrides are audited.

Contents

Process and milestones **4**

Daily rules and escalation **4**

Login **5**

1. Select the gym 5
2. Sign in 6
3. Verify the email code 7
4. Open the sales workspace 8

Capture and funnel **9**

5. Capture a new prospect 9
6. Work the Prospect Sales CRM 10
7. Record contact accurately 11
8. Record appointment attendance 12
9. Record the consultation decision 13
10. Open the linked application 14
11. Read the funnel report 15

Application and documents **16**

12. Capture the membership draft 16
13. Find the application 17
14. Check the submission gates 18
15. Upload the supporting documents 19
16. Check bank-statement qualification 20
17. Resolve an approval request 21

NuPay and Itensity **22**

18. Prepare the NuPay mandate 22
19. Submit the mandate to NuPay 23
20. Recognise submission without approval 24
21. Confirm DebiCheck approval 25
22. Push to Itensity after approval 26
23. Read Active with incomplete compliance 27
24. Verify the recorded member reference 28

Signing, fee and completion **29**

25. Open the membership contract 29
26. Capture the signature 30
27. Record the registration fee 31
28. Confirm compliance and sales credit 32

Troubleshooting and final checklist **33**

Detailed Sales practice **34**

Start and finish every shift with a work review 34
Capture a prospect without creating a duplicate 34
Record calls conversations and appointments correctly 35
Work a decision follow-up and close the loop 35
Check evidence before submission and activation 36
Complete the sale and hand the member over 36

Collections **38**

Open the dashboard and choose the right work 38
Verify the balance before contacting the member 39

Complete a collection call and record the outcome 39
Follow the communication sequence and measure honestly 40
Record payment and resolve or escalate the case 40

Promise to Pay 41
Prepare the arrangement with the member 41
Enter the PTP and read the saved result 41
Understand approval access and exceptions 42
Work through a calculation without confusing the amounts 42
Record receipts and monitor a missed promise 43

DebiCheck and NuPay 44
Choose the correct member payer and mandate 44
Interpret status and follow up with the member 44
Handle a failed debit or a change in banking details 45

Queries 46
Log the issue and assign an owner 46
Investigate and use status to show the real position 47
Escalate clearly and request a controlled approval 48
Link a PTP and close the Query with evidence 48

Notifications supervision and daily handover 49
Set up the supervisor and work the alert 49
Keep acknowledged work from being forgotten 50

Practice assessment and daily checklist 51
Practise the full handover with five cases 51
Daily operating checklist 51

Process and milestones

The application tracks four separate milestones:

Milestone	What it means
Agreed to Join	The client has accepted the membership proposal.
Application Started	The draft is being completed.
Activated	Itensity activation succeeded.
Compliance Complete	All requirements are satisfied and the consultant may receive sales credit.

NuPay submission requires the uploaded ID copy and a qualifying bank-statement analysis. An Itensity reference is not required; the member's ID is used in Client Reference 1. Confirmed DebiCheck approval is required before the ordinary Itensity push.

After activation, confirm signing, full registration-fee payment and all remaining compliance. Contract signing can happen earlier; it must be complete before consultant sales credit. General payments do not replace the registration fee.

Navigation: Login (1–4); Capture and funnel (5–11); Application and documents (12–17); NuPay and Itensity (18–24); Signing, fee and completion (25–28).

Daily rules and escalation

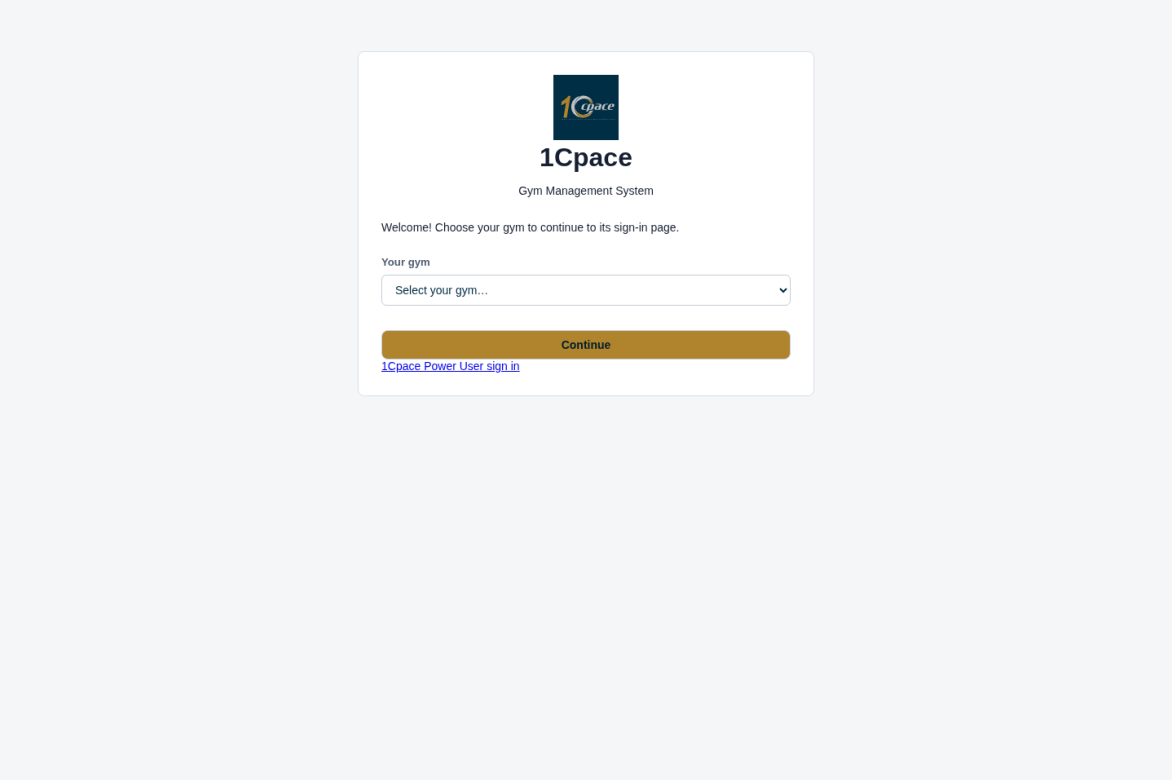

Topic	Rule
Capture	Reception handles walk-ins; sales consultants handle referral, outreach and social-media sources; admins can capture all sources. Rotation applies to eligible available consultants; consultant-captured referrals/outreach/social leads stay with that consultant.
Funnel	Follow the guided card, record actual contact/attendance and respect do-not-contact instructions. Walk-ins are attendance rather than booked appointments. Decision follow-ups use five working days; expired decisions are recycled. Manual stage changes are restricted and logged.
Bank statement does not qualify	Inform the client or escalate to the manager. A manager cannot bypass the submission gates. Only an admin can explicitly override a requirement, with an audit record.
Checklist status	Checklist status comes from its source workflow: uploading and analysis, confirmed mandate status, contract signing, fee payment and required approval. Changing a checklist selection is not a substitute for evidence.
Interface note	The current static "Required to Push to Itensity" list still contains an older contract-first label. Follow the actual push blockers and Submit Application to NuPay panel. Contract signing remains required for completed-sale credit.

PART 1

Login

Steps 1–4 · Select the gym, sign in, verify your email code and open the sales workspace.

1. Select the gym

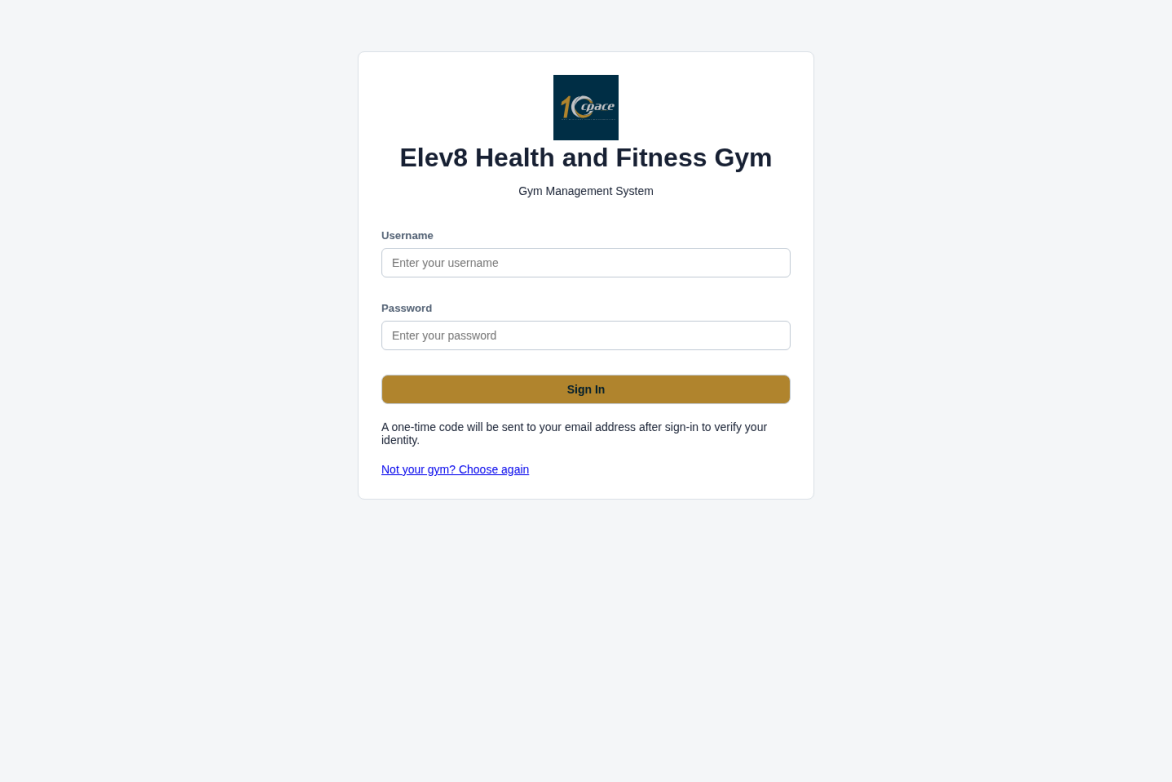

Screenshot 1 — Select the gym. Local application; synthetic training example.

1. Choose the correct gym from the dropdown.
2. Select Continue before entering credentials.

Expected result: The sign-in page identifies your chosen gym.

Common mistake: Working in the wrong gym; use Choose again if necessary.

2. Sign in

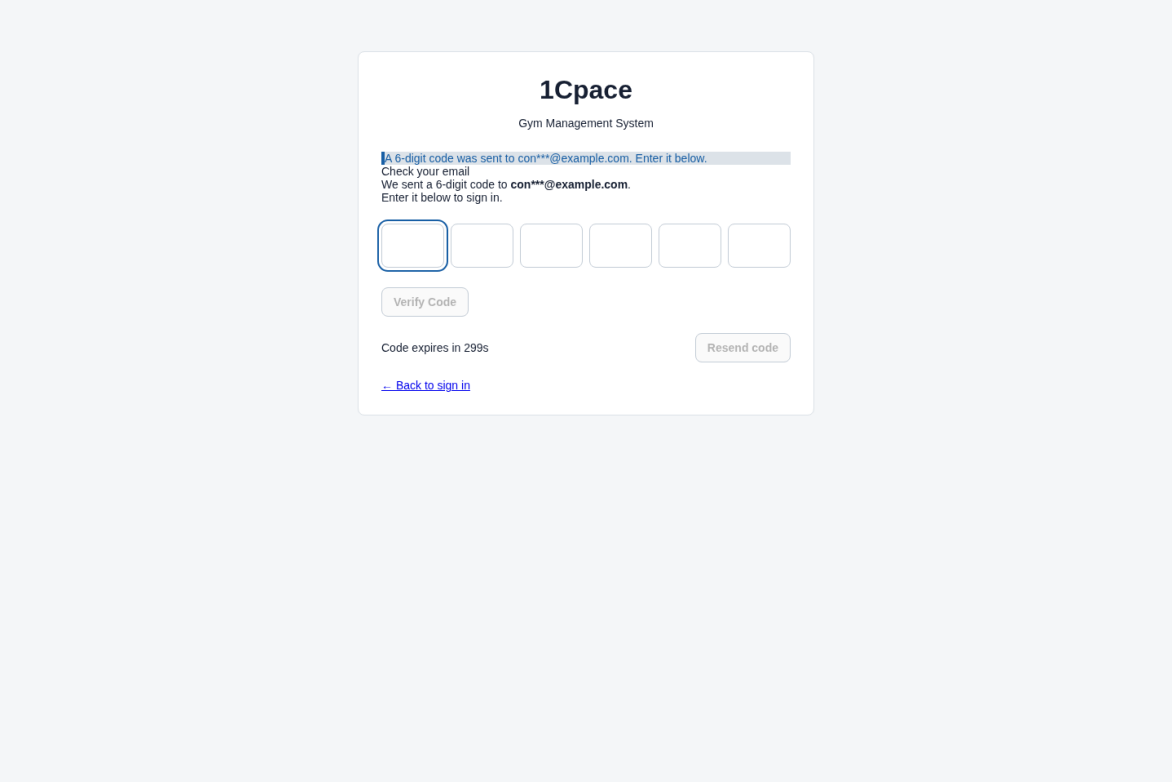

Screenshot 2 — Sign in. Local application; synthetic training example.

1. Enter your assigned username and password.
2. Select Sign In.

Expected result: The application requests email verification.

Common mistake: Sharing credentials or using another consultant's account.

3. Verify the email code

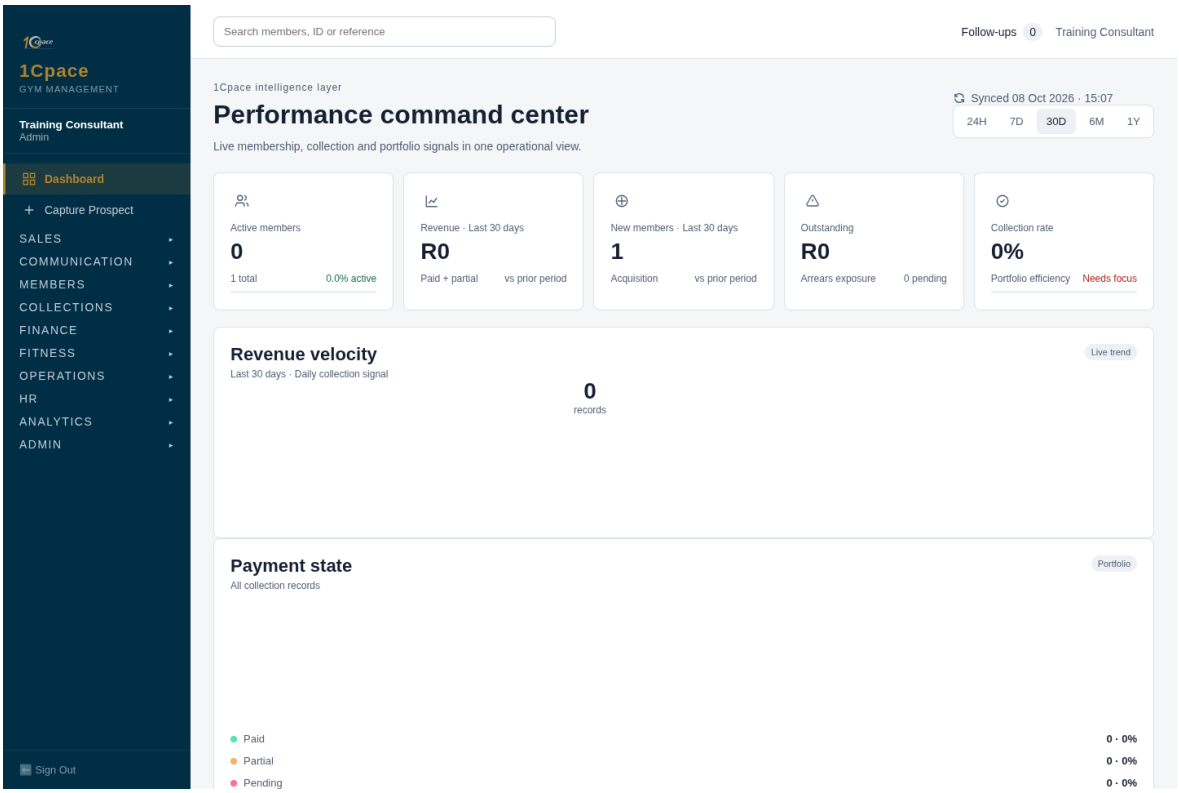

Screenshot 3 — Verify the email code. Local application; synthetic training example.

1. Read the newest six-digit code in your registered mailbox.
2. Enter it and select Verify Code; use Resend if necessary.

Expected result: Successful verification opens the dashboard; a first-login password change may appear first.

Common mistake: Using an older code after requesting a new one. Codes expire and attempts are limited.

4. Open the sales workspace

Screenshot 4 — Open the sales workspace. Local application; synthetic training example.

1. Check your gym and signed-in name.
2. Use Capture Prospect, Sales CRM or Applications to begin the appropriate task.

Expected result: You enter the relevant sales workspace.

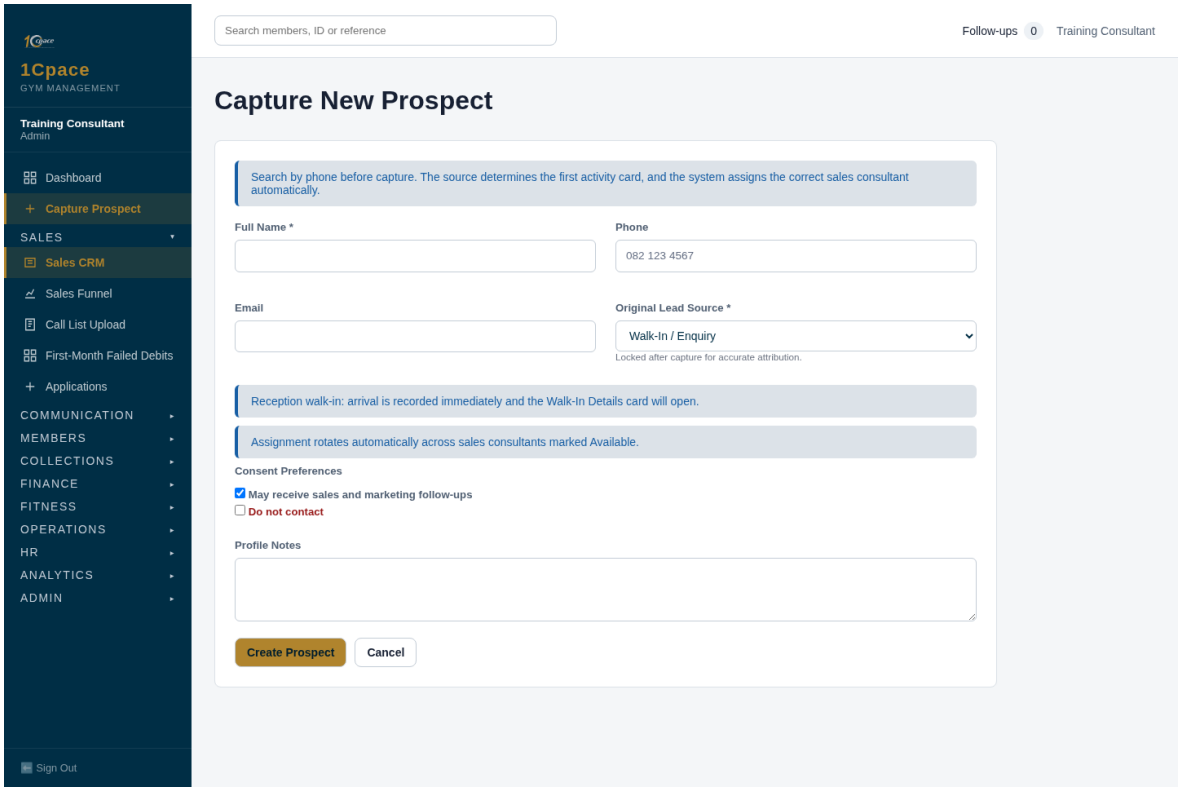

Common mistake: Treating dashboard totals as proof that an individual application is complete.

PART 2

Capture and funnel

Steps 5–11 · Capture prospects, work the Sales CRM, record contact, attendance and decisions, and read the funnel report.

5. Capture a new prospect

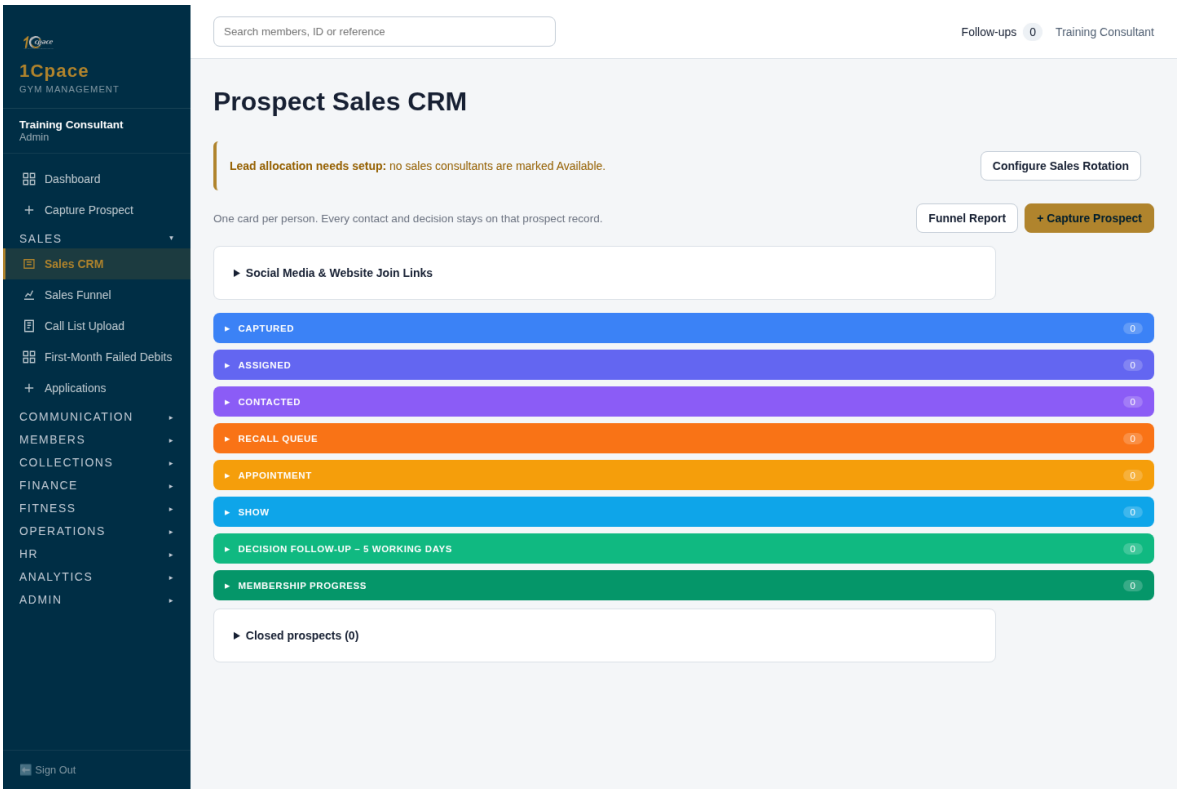

Screenshot 5 — Capture a new prospect. Local application; synthetic training example.

1. Search by phone first and open an existing record if found.
2. Enter full name, phone and email; choose Original Lead Source.
3. Add the referrer or campaign where required, record consent and select Create Prospect.

Expected result: A prospect is created and assigned using the sales allocation rules.

Common mistake: Creating duplicates or choosing an inaccurate source. Original source is locked after capture.

6. Work the Prospect Sales CRM

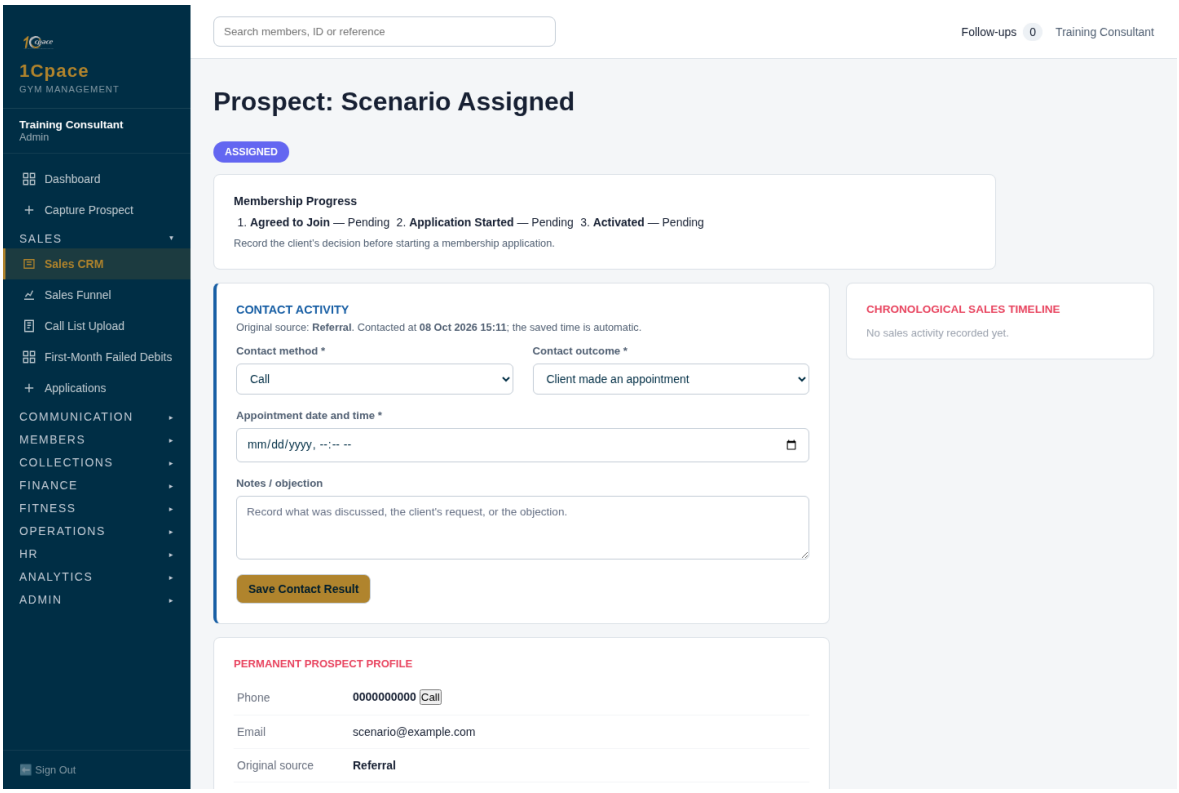

Screenshot 6 — Work the Prospect Sales CRM. Local application; synthetic training example.

1. Open the stage containing your prospect.
2. Read the assigned consultant and next action, then select Open.

Expected result: The prospect's guided activity screen opens.

Common mistake: Moving a lead forward merely because a call was attempted. No response is an attempt, not a conversation.

7. Record contact accurately

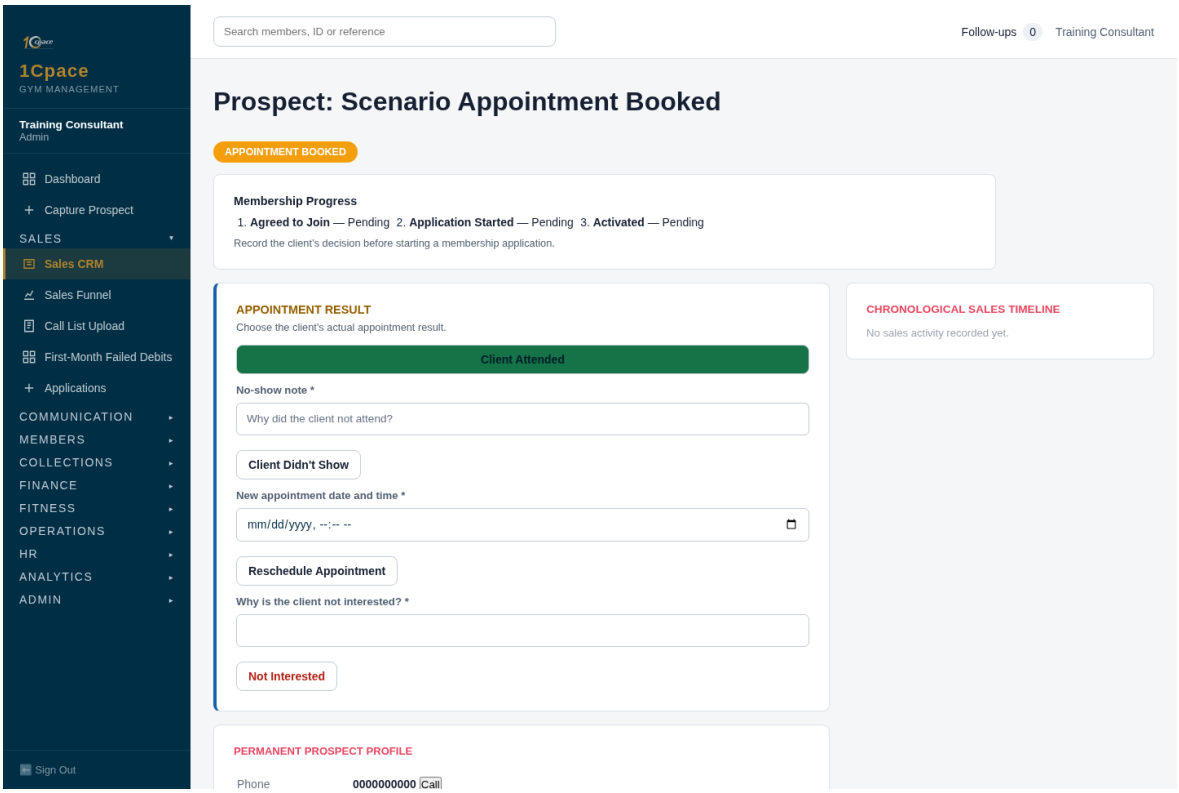

Screenshot 7 — Record contact accurately. Local application; synthetic training example.

1. Follow Contact Activity and select the contact method.
2. Record the actual outcome: appointment, follow-up, not interested or no response.
3. Enter the required appointment/follow-up details and save.

Expected result: The timeline records the contact and the next guided action is set.

Common mistake: Recording an unanswered call as successful contact.

8. Record appointment attendance

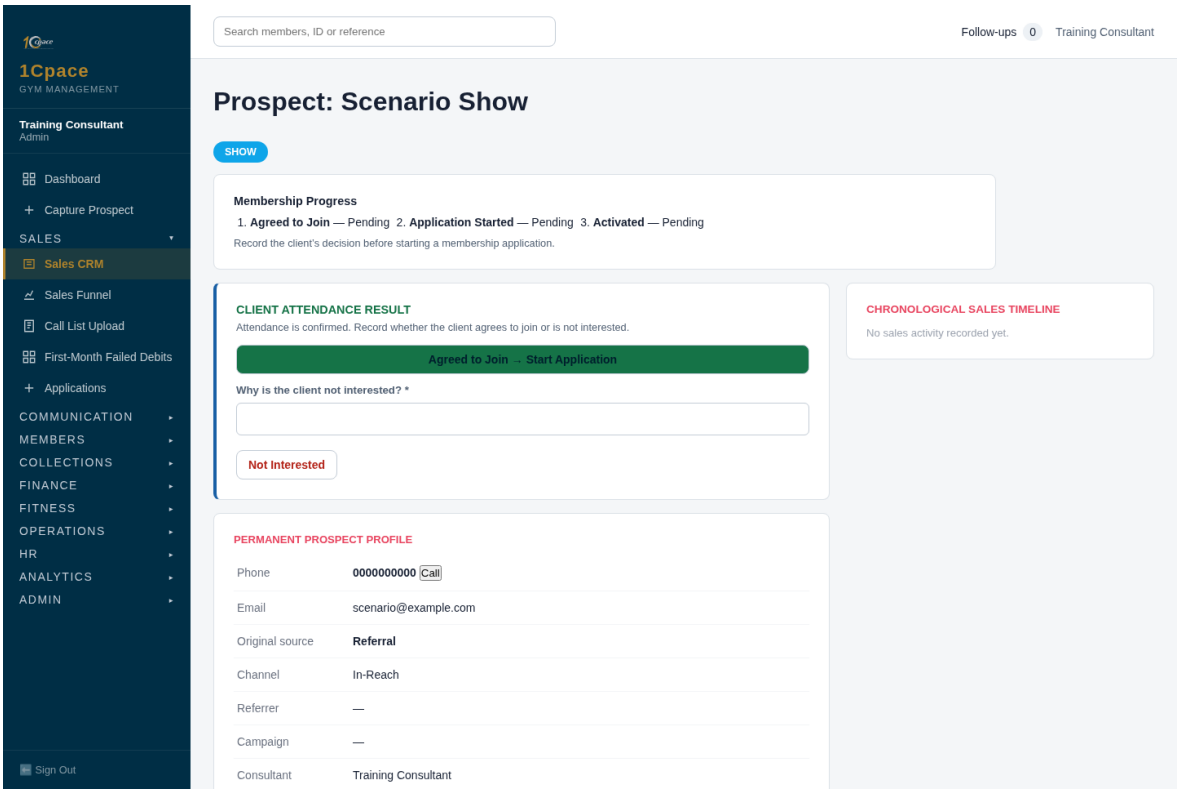

Screenshot 8 — Record appointment attendance. Local application; synthetic training example.

1. Open Appointment Result after the appointment.
2. Record whether the prospect attended or did not attend.

Expected result: Attendance is recorded before the separate decision about joining.

Common mistake: Counting a walk-in as a booked appointment, or treating attendance as a completed sale.

9. Record the consultation decision

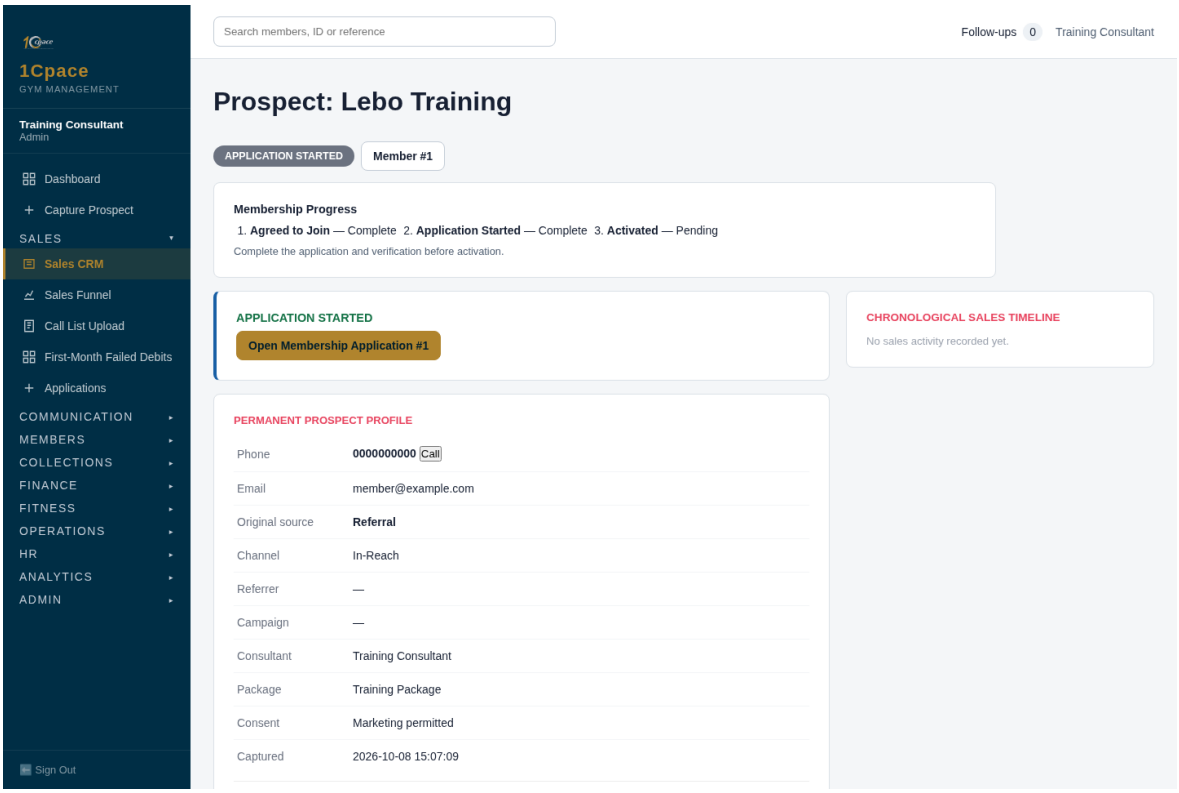

Screenshot 9 — Record the consultation decision. Local application; synthetic training example.

1. Follow Client Attendance Result or Walk-In Details.
2. Record whether the client agrees to join, needs decision follow-up or is not interested, using the options presented.

Expected result: Agreed to Join is a commitment milestone; the application is the next step.

Common mistake: Calling the member activated just because they agreed to join.

10. Open the linked application

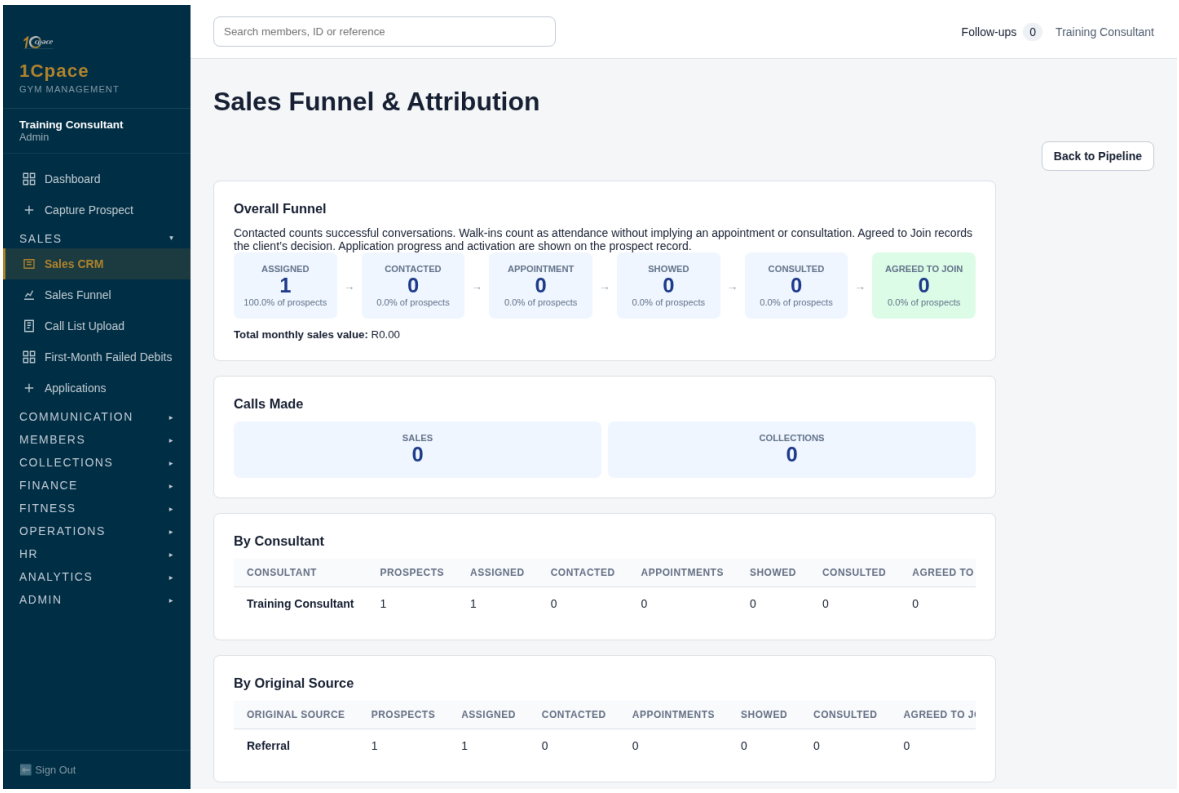

Screenshot 10 — Open the linked application. Local application; synthetic training example.

1. Use the application link on the prospect detail page.
2. Read the Membership Progress summary and timeline.

Expected result: Application Started is shown separately from Agreed to Join and Activated.

Common mistake: Treating the milestones as interchangeable.

11. Read the funnel report

Screenshot 11 — Read the funnel report. Local application; synthetic training example.

1. Open Sales Funnel & Attribution.
2. Review conversations, appointments, attendance and membership milestones in their own columns.

Expected result: The report distinguishes activities from outcomes.

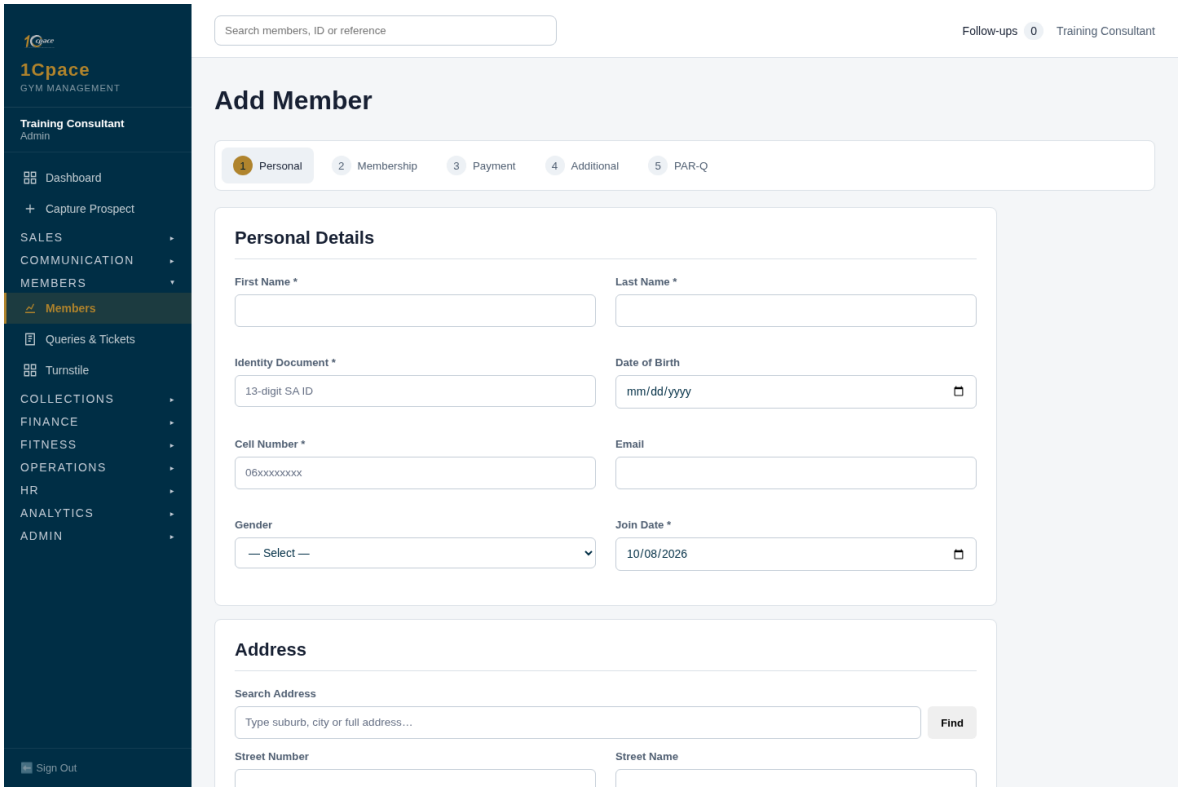

Common mistake: Assuming every joined/activated count qualifies for consultant sales credit.

PART 3

Application and documents

Steps 12–17 · Capture the membership draft, upload the ID and bank statement, check qualification and resolve approvals.

12. Capture the membership draft

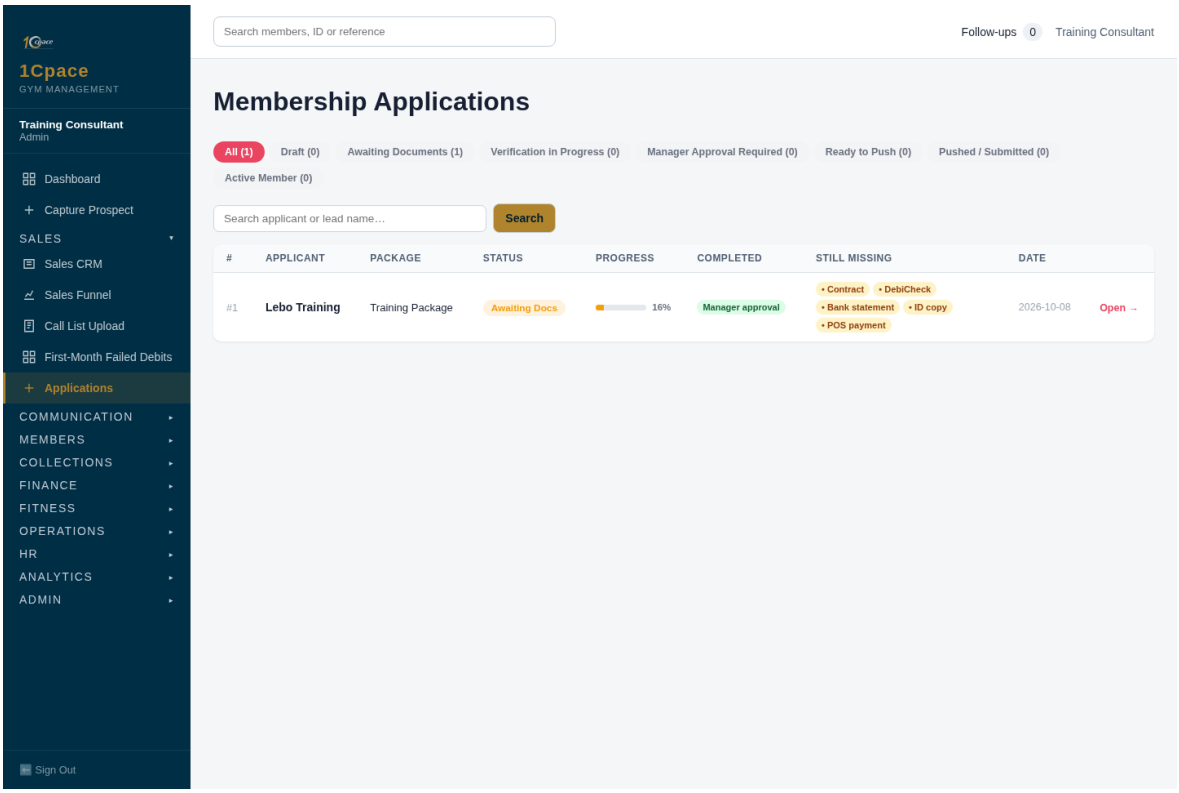

Screenshot 12 — Capture the membership draft. Local application; synthetic training example.

1. Enter the client's real, valid SA ID and required personal details.
2. Complete membership, payment, medical and other tabs as applicable.
3. Save the draft and continue to document upload; do not expect a draft save to submit to NuPay.

Expected result: The member/application record is saved for document and mandate preparation.

Common mistake: Copying the all-zero training identity or banking values shown here. They are placeholders, not valid submission data.

13. Find the application

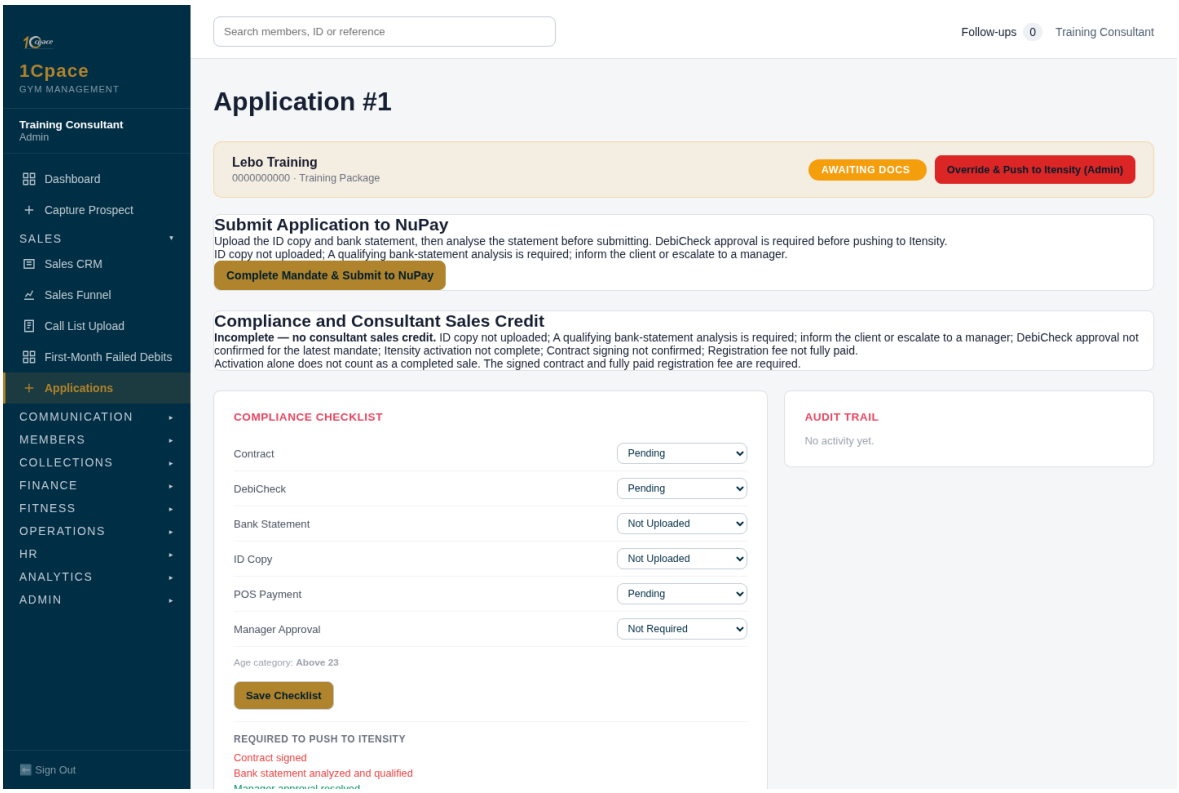

Screenshot 13 — Find the application. Local application; synthetic training example.

1. Open Applications and locate the client.
2. Read status, missing items and compliance progress; select Open.

Expected result: The application's detailed checklist and gates are visible.

Common mistake: Equating an application row or an Active label with complete compliance.

14. Check the submission gates

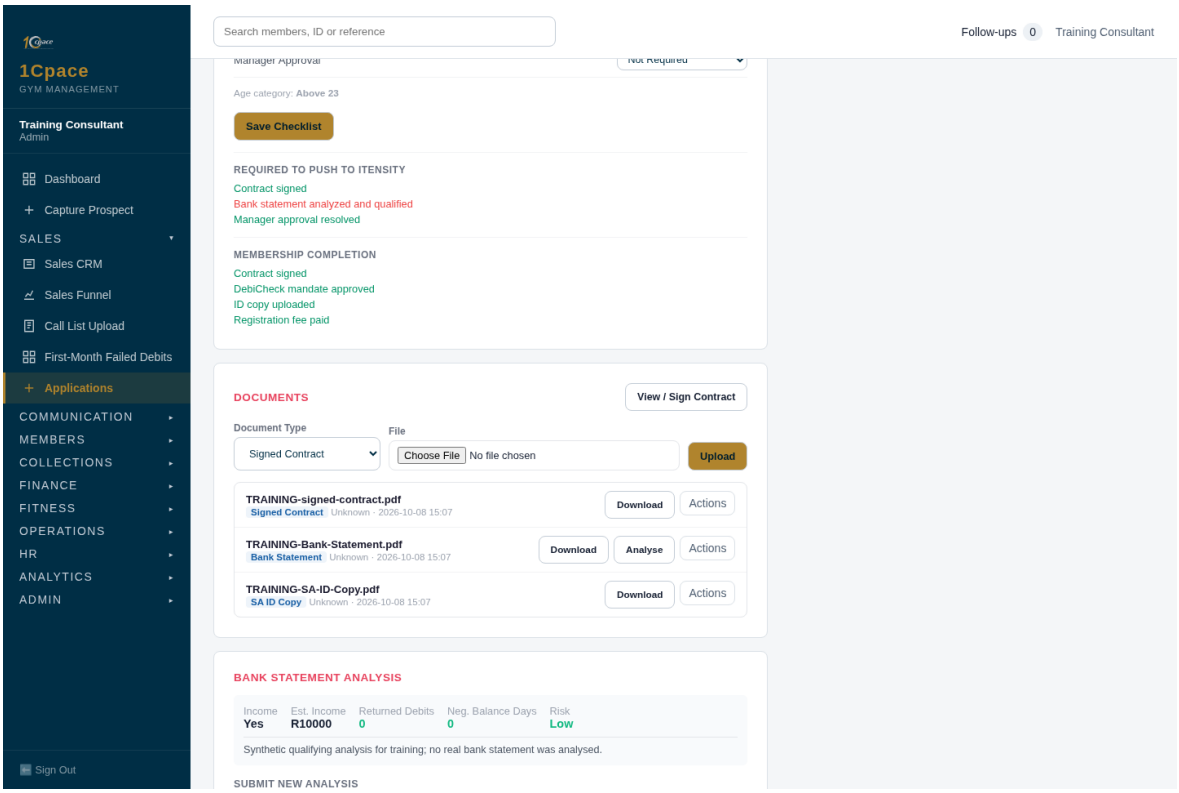

Screenshot 14 — Check the submission gates. Local application; synthetic training example.

1. Read Submit Application to NuPay and the listed blockers.
2. Gather the ID copy and bank statement before submitting.
3. If the statement does not qualify, inform the client or escalate to the manager.

Expected result: Ordinary submission stays blocked until required evidence and qualifying analysis exist.

Common mistake: Trying to bypass a blocker as a consultant or manager. Only an admin can make an explicit audited override.

15. Upload the supporting documents

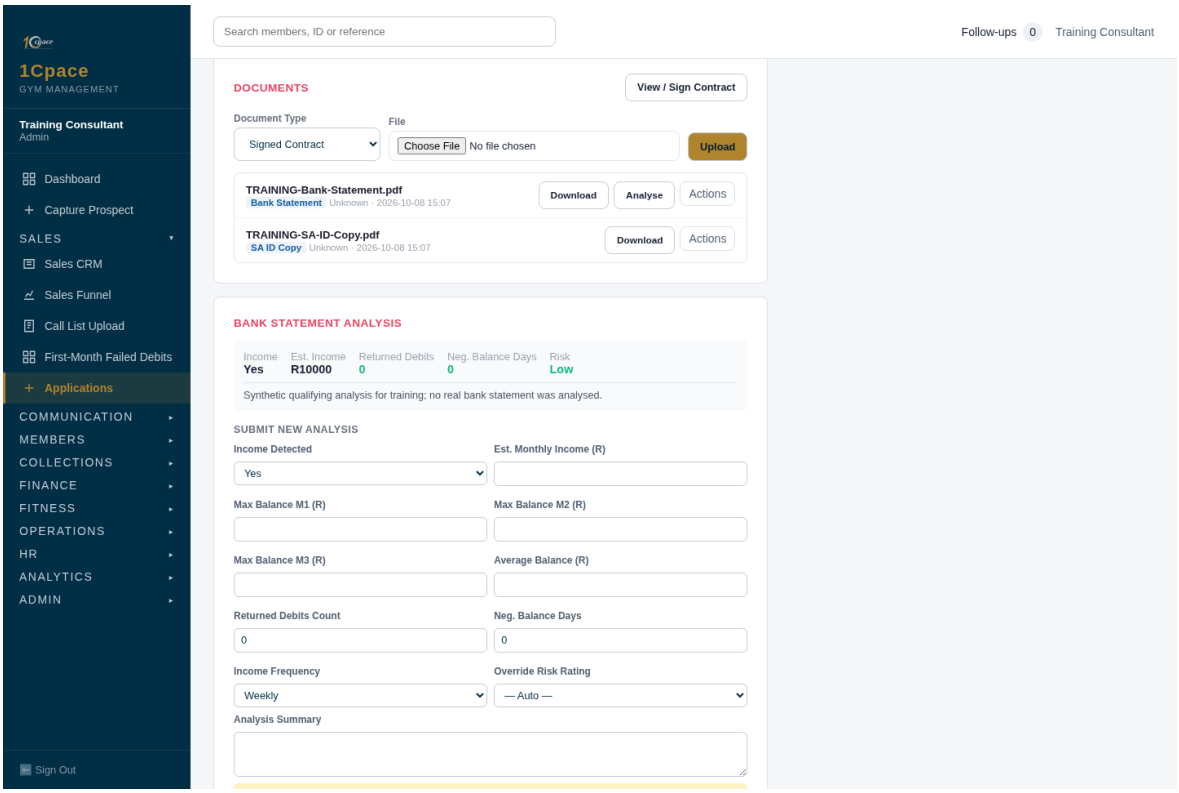

Screenshot 15 — Upload the supporting documents. Local application; synthetic training example.

1. Under Documents, choose SA ID Copy or Bank Statement.
2. Choose the correct client file and select Upload.
3. Upload the bank statement as PDF for analysis and verify the uploaded document belongs to this client.

Expected result: The ID and statement appear in the application's document list.

Common mistake: Uploading a document against the wrong member, or assuming uploading alone means the statement qualifies.

16. Check bank-statement qualification

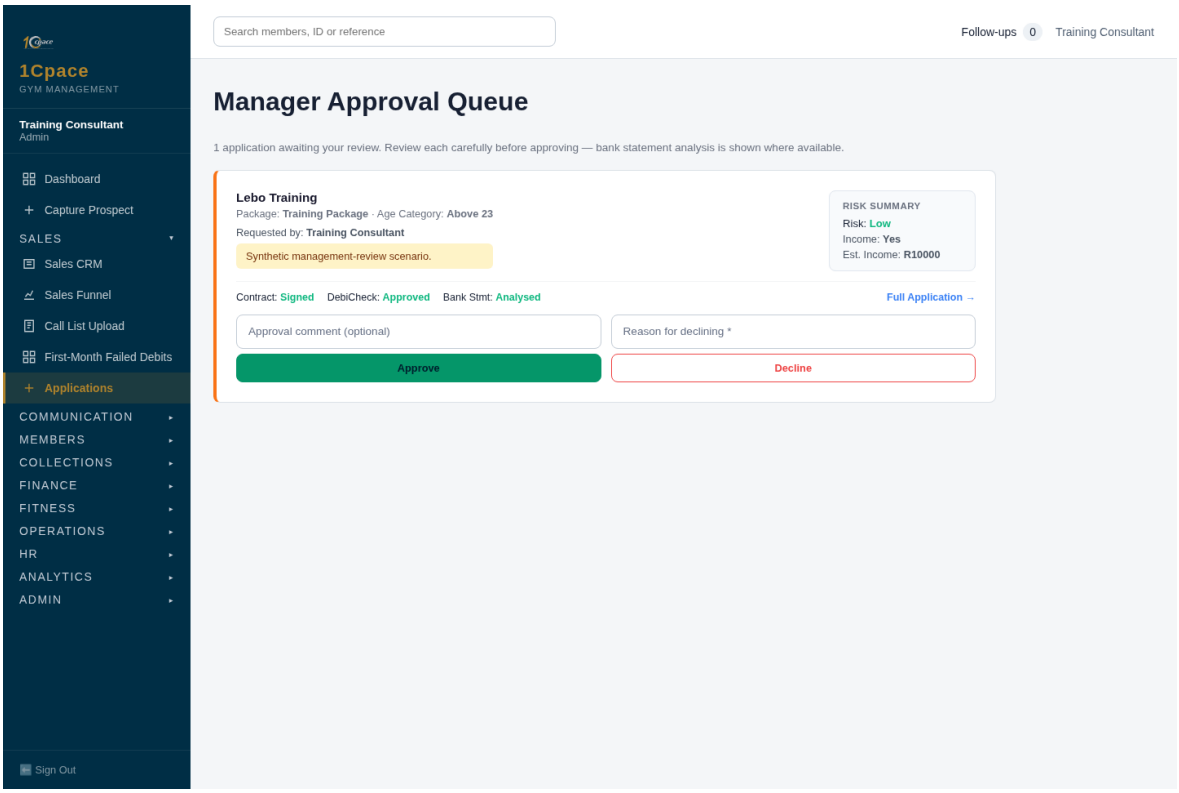

Screenshot 16 — Check bank-statement qualification. Local application; synthetic training example.

1. Select Analyse for the uploaded bank-statement PDF.
2. Review the qualification result, income information and risk summary.
3. Follow the existing two-month income/30% balance qualification rule; escalate a failed result rather than proceeding.

Expected result: A qualifying result, with the ID copy, permits the NuPay submission path.

Common mistake: Treating a positive balance or a low risk label alone as proof that the qualification gate passed.

17. Resolve an approval request

Screenshot 17 — Resolve an approval request. Local application; synthetic training example.

1. Where the application requires approval, refer it to the Manager Approval Queue.
2. The authorised reviewer checks the evidence and approves or declines.
3. Resolve any guardian consent requirements indicated on the application.

Expected result: Required approvals are recorded through their source workflow.

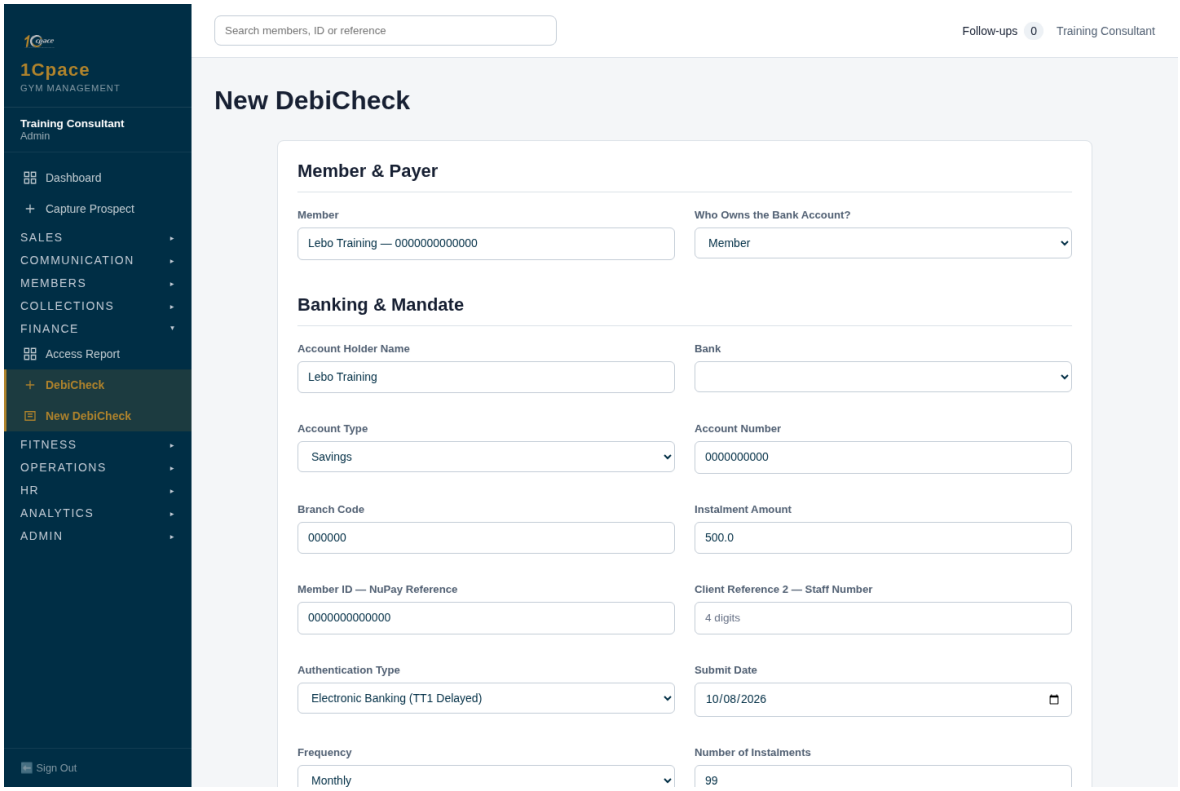

Common mistake: Confusing manager approval with permission to bypass missing documents or DebiCheck approval. Staff must not approve their own requests.

PART 4

NuPay and Itensity

Steps 18–24 · Prepare and submit the mandate, confirm DebiCheck approval, push to Itensity and verify the reference.

18. Prepare the NuPay mandate

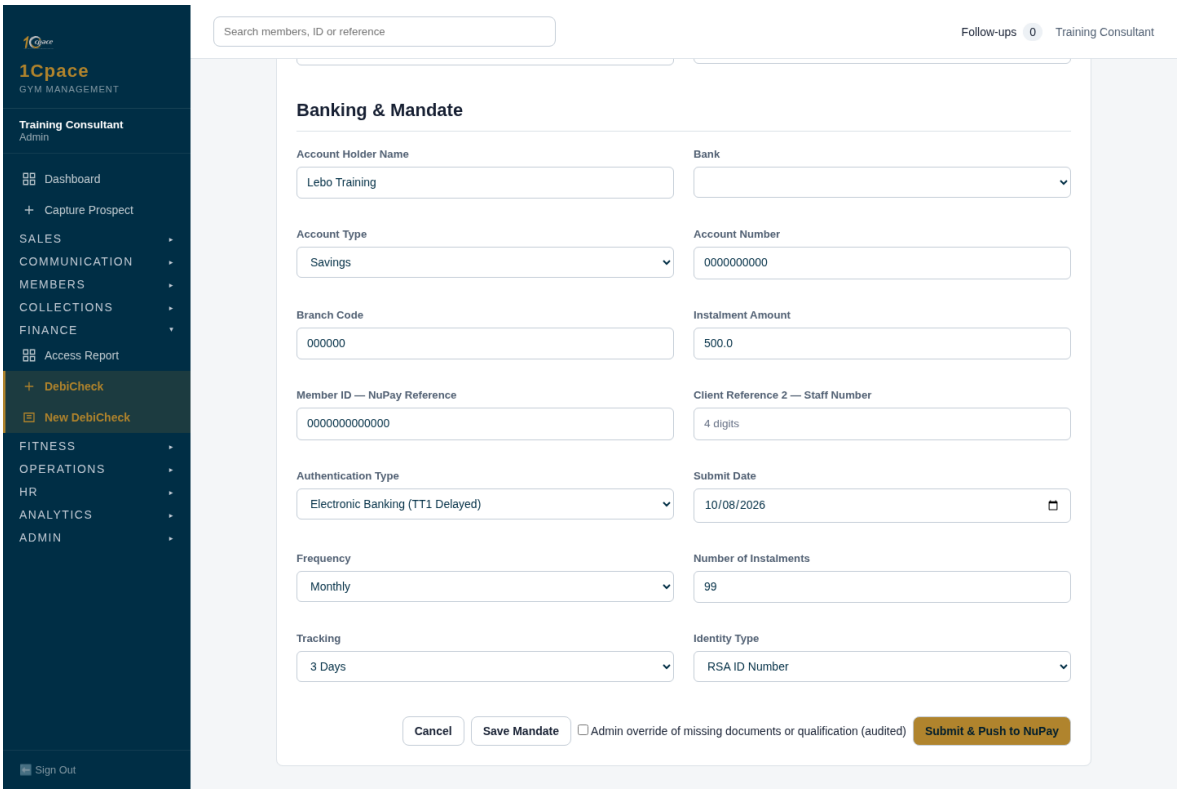

Screenshot 18 — Prepare the NuPay mandate. Local application; synthetic training example.

1. From the application, use Complete Mandate & Submit to NuPay, or open New DebiCheck for the member.
2. Check the member, payer and all banking details, instalment and debit date.
3. Client Reference 1 uses the member's ID, not an Itensity reference; keep a third-party payer's identity separate.
4. Use the submit/push action shown after the required documents and qualifying analysis are in place.

Expected result: The application can go to NuPay before an Itensity client reference exists.

Common mistake: Waiting for Itensity first, or replacing the member reference with a third-party payer's ID.

19. Submit the mandate to NuPay

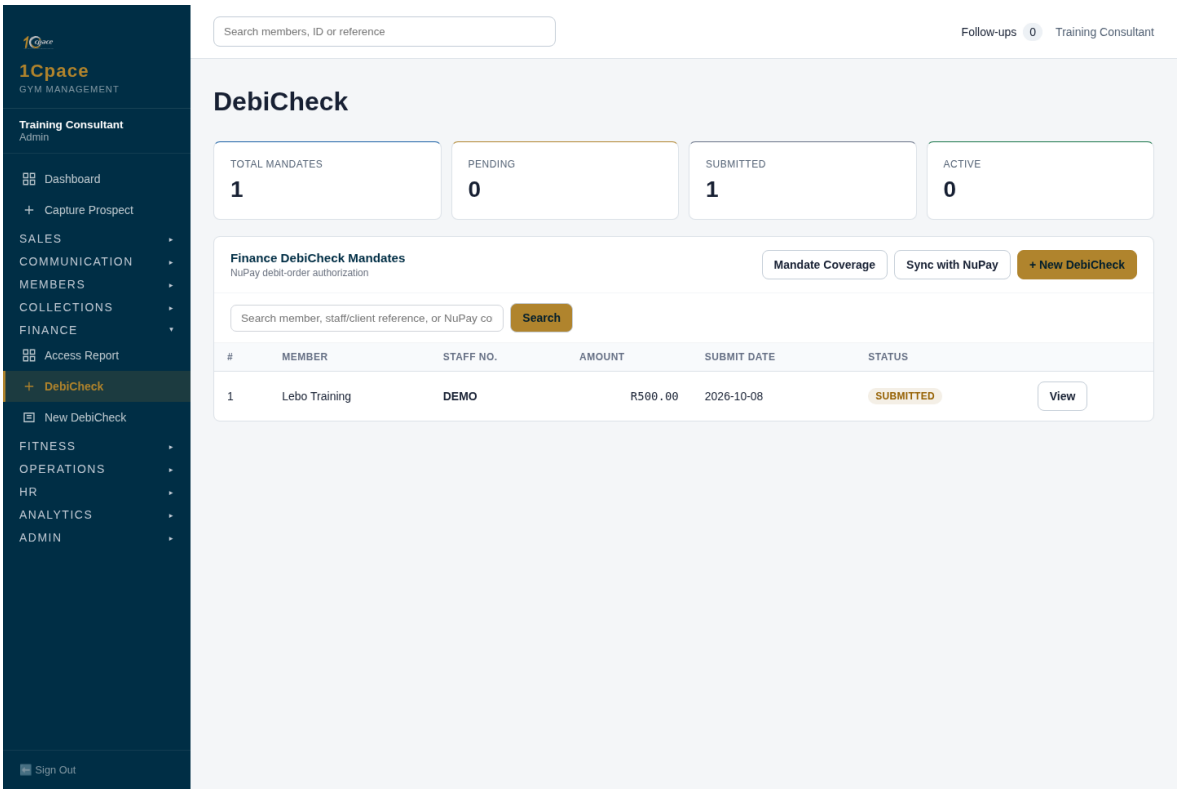

Screenshot 19 — Submit the mandate to NuPay. Local application; synthetic training example.

1. Recheck all mandate values and the qualifying document prerequisites.
2. Select Submit & Push to NuPay; Save Mandate alone only saves the mandate.

Expected result: NuPay receives the submission when the gates pass; bank approval is still required.

Common mistake: Confusing Save Mandate with a successful submission or approval.

20. Recognise submission without approval

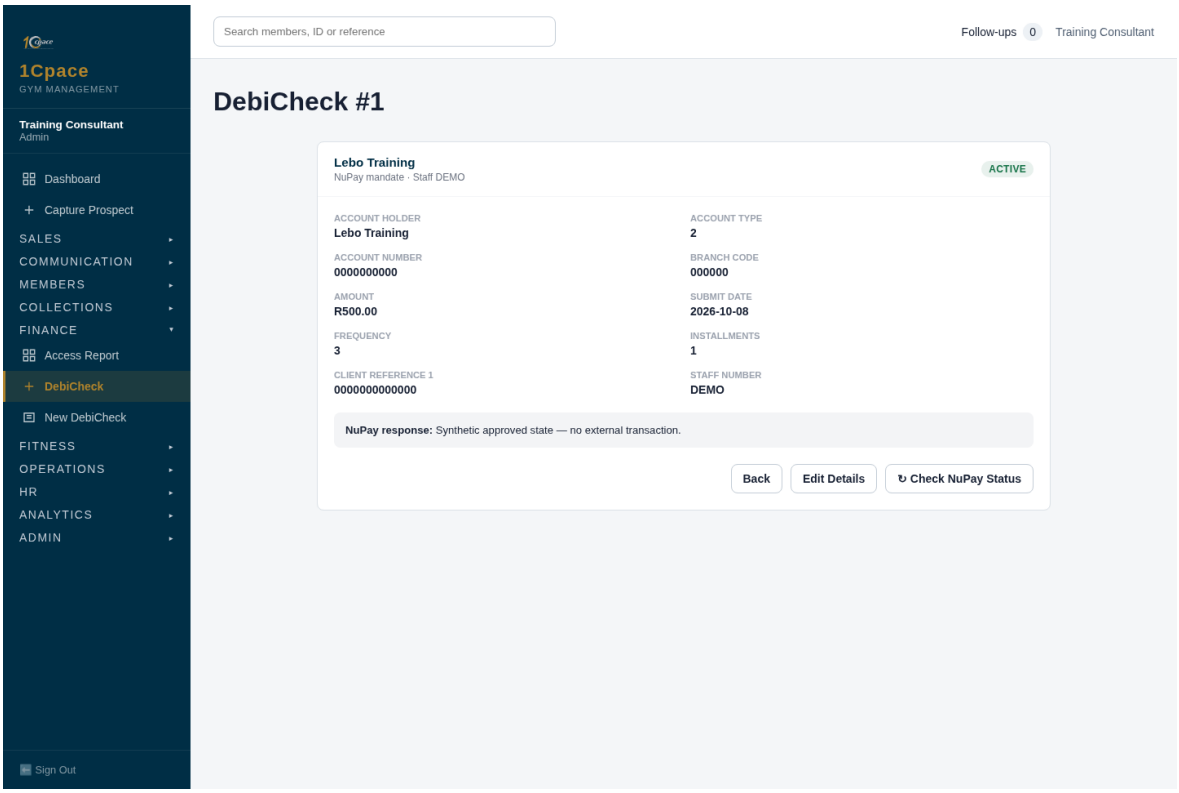

Screenshot 20 — Recognise submission without approval. Local application; synthetic training example.

1. Read the mandate status and NuPay response.
2. Ask the client to approve the request through their bank.
3. Use the mandate detail screen's Check NuPay Status action to retrieve the confirmed result.

Expected result: Submitted means sent; it does not mean approved and does not unlock ordinary Itensity activation.

Common mistake: Promising activation when NuPay has only acknowledged submission.

21. Confirm DebiCheck approval

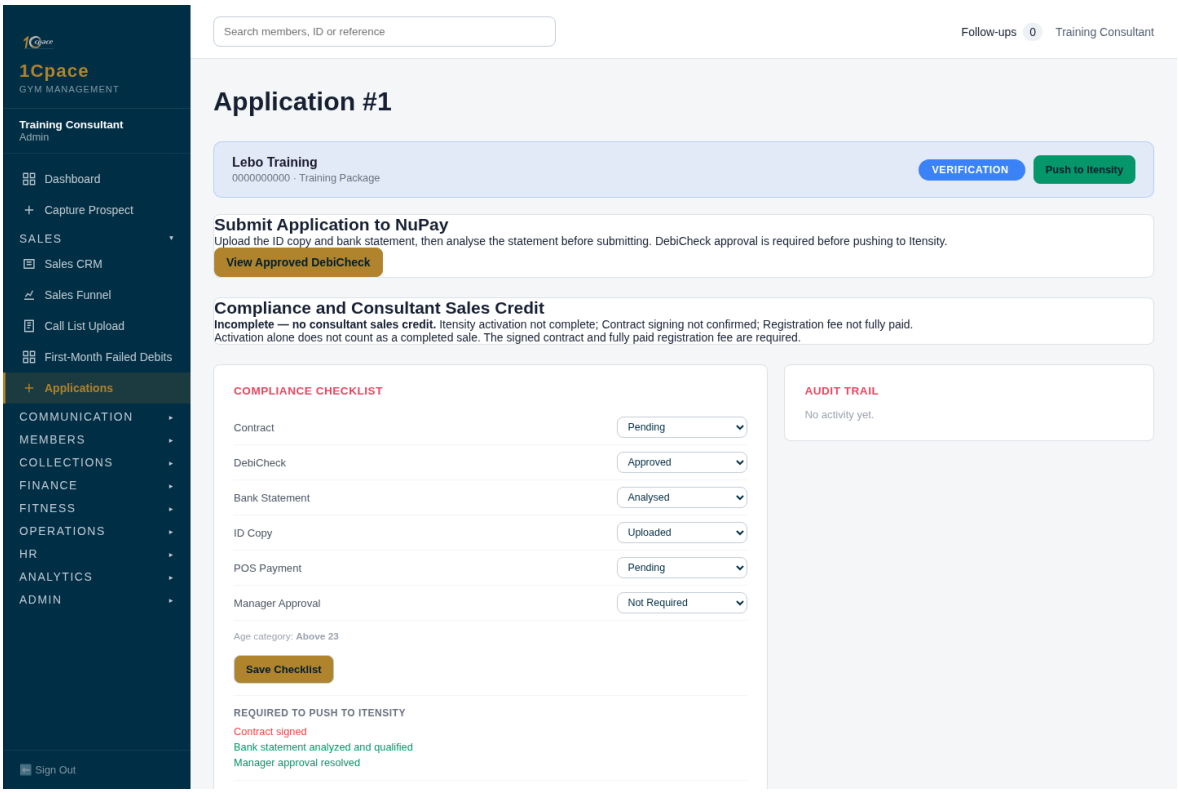

Screenshot 21 — Confirm DebiCheck approval. Local application; synthetic training example.

1. Open the mandate and confirm the returned approval/active state.
2. Check that the application's DebiCheck checklist reflects confirmed approval.
3. If rejected or failed, read the response and correct the issue before retrying.

Expected result: Confirmed approval for the latest mandate satisfies the DebiCheck gate.

Common mistake: Manually ticking Approved or assuming an older approved mandate covers a newer unapproved one.

22. Push to Itensity after approval

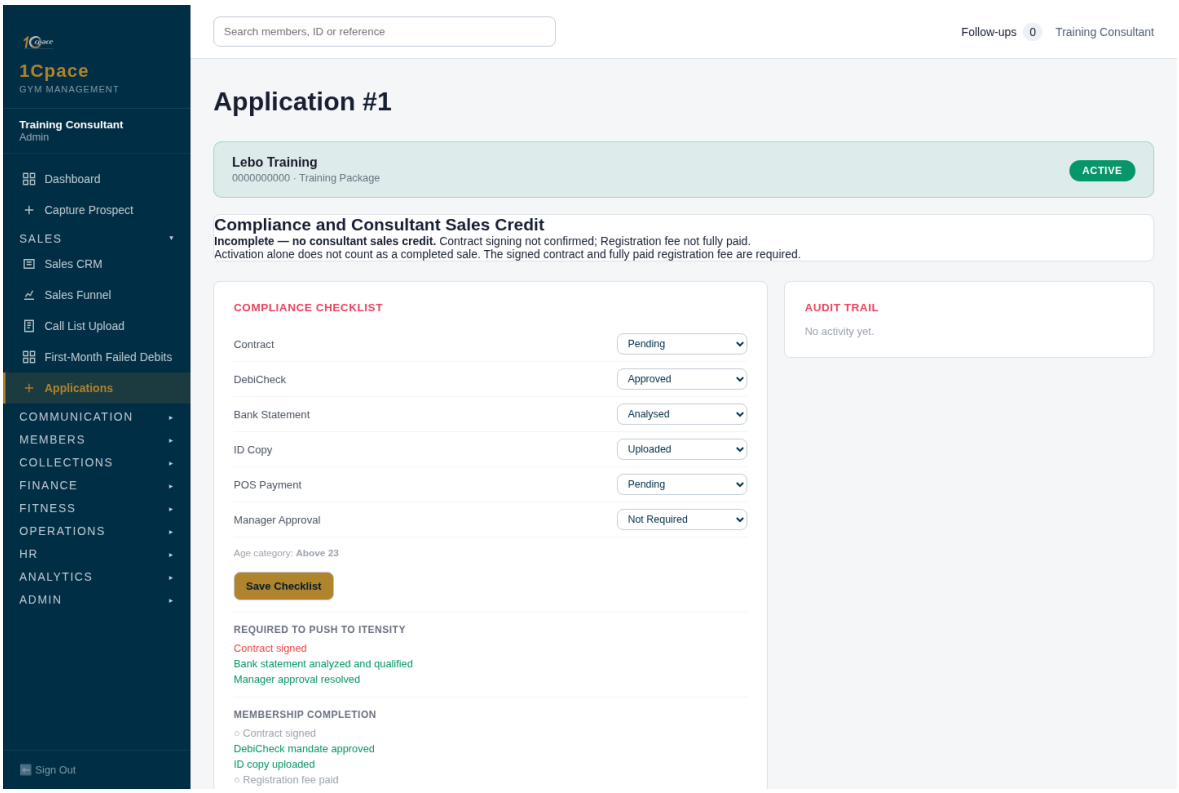

Screenshot 22 — Push to Itensity after approval. Local application; synthetic training example.

1. Return to the application and read any remaining blockers.
2. Confirm the ID, qualifying statement, confirmed DebiCheck and required approvals.
3. Select Push to Itensity once; wait and refresh to inspect the result.

Expected result: The push runs in the background. A successful result records activation and the Itensity reference.

Common mistake: Repeatedly submitting a push, or believing the older static Required to Push list overrides the actual blockers.

23. Read Active with incomplete compliance

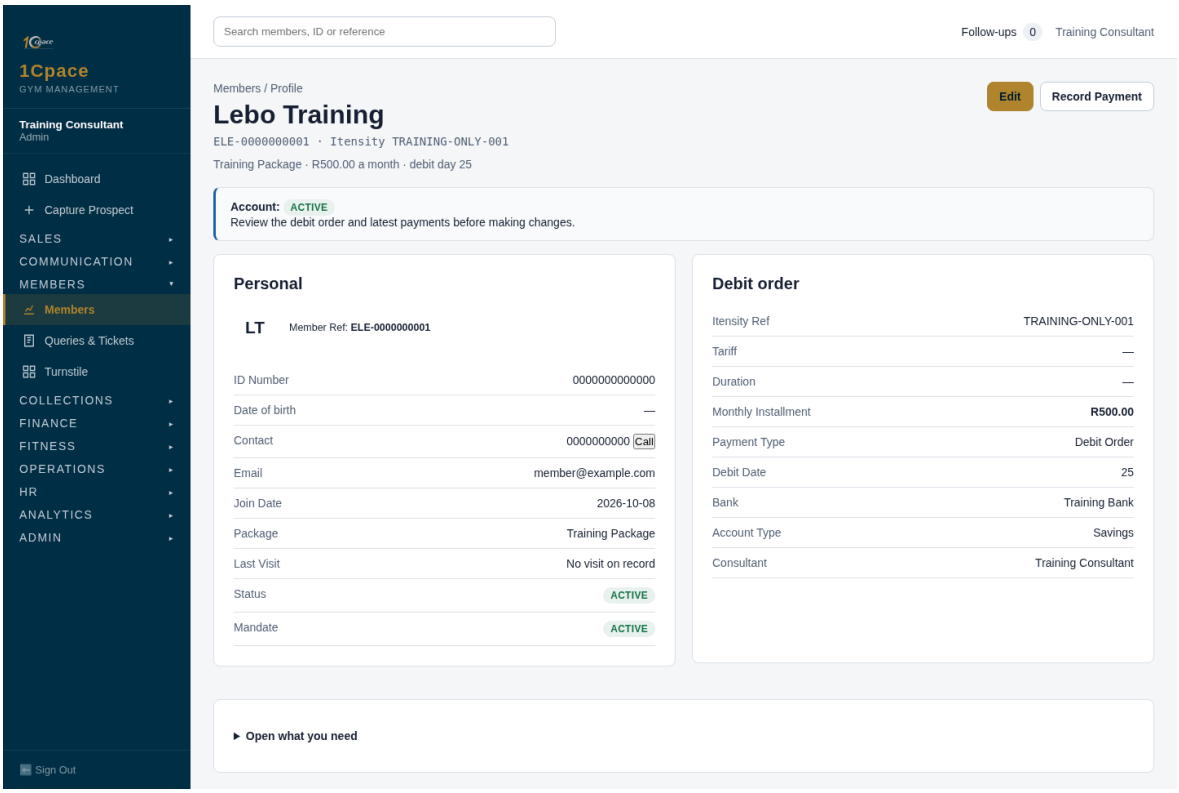

Screenshot 23 — Read Active with incomplete compliance. Local application; synthetic training example.

1. After a successful Itensity push, check the activation/reference on the application/member.
2. Read Compliance and Consultant Sales Credit.
3. Complete the signed contract and fully paid registration fee if still missing.

Expected result: An activated account can remain Incomplete — no consultant sales credit.

Common mistake: Counting activation as a completed sale.

24. Verify the recorded member reference

Screenshot 24 — Verify the recorded member reference. Local application; synthetic training example.

1. Open the activated member profile.
2. Check the stored Itensity reference and member status.

Expected result: The activation reference is stored independently of the member ID used in the NuPay reference field.

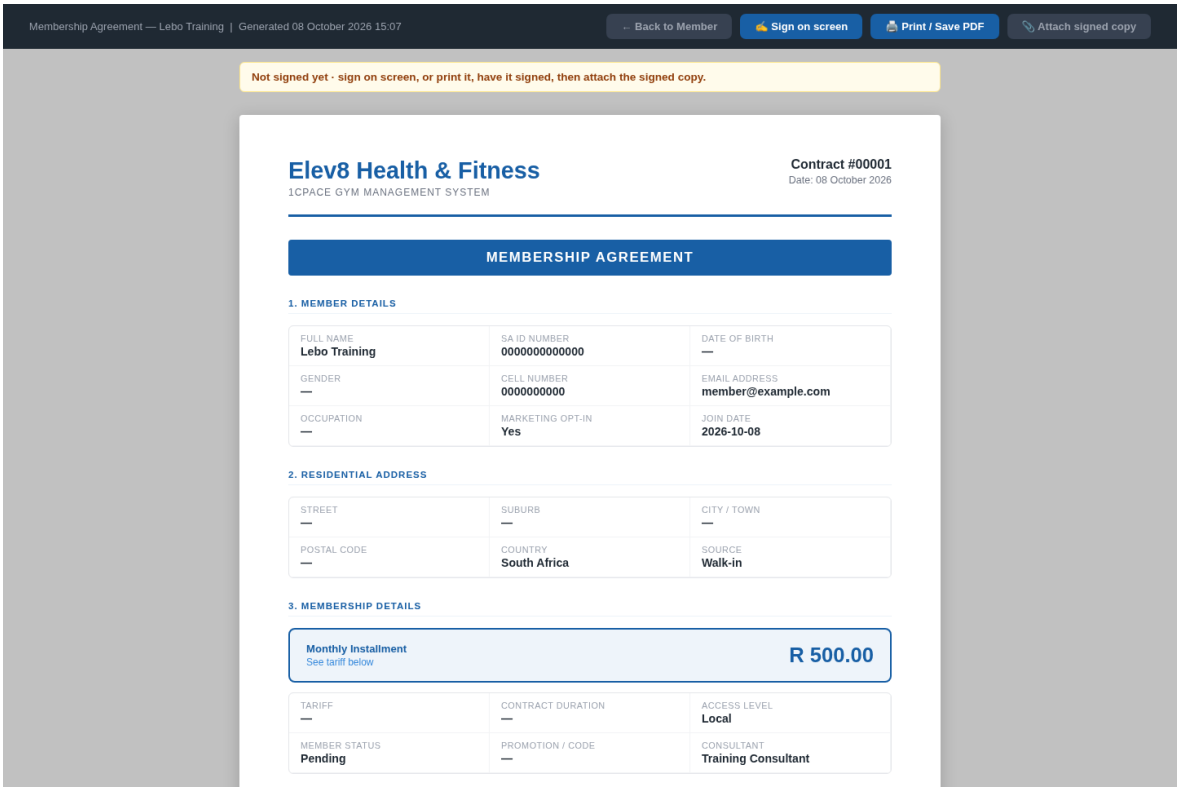

Common mistake: Replacing the NuPay member-ID reference with the Itensity reference. The TRAINING-ONLY value shown is a seeded example.

PART 5

Signing, fee and completion

Steps 25–28 · Sign the contract, record the registration fee and confirm compliance and sales credit.

25. Open the membership contract

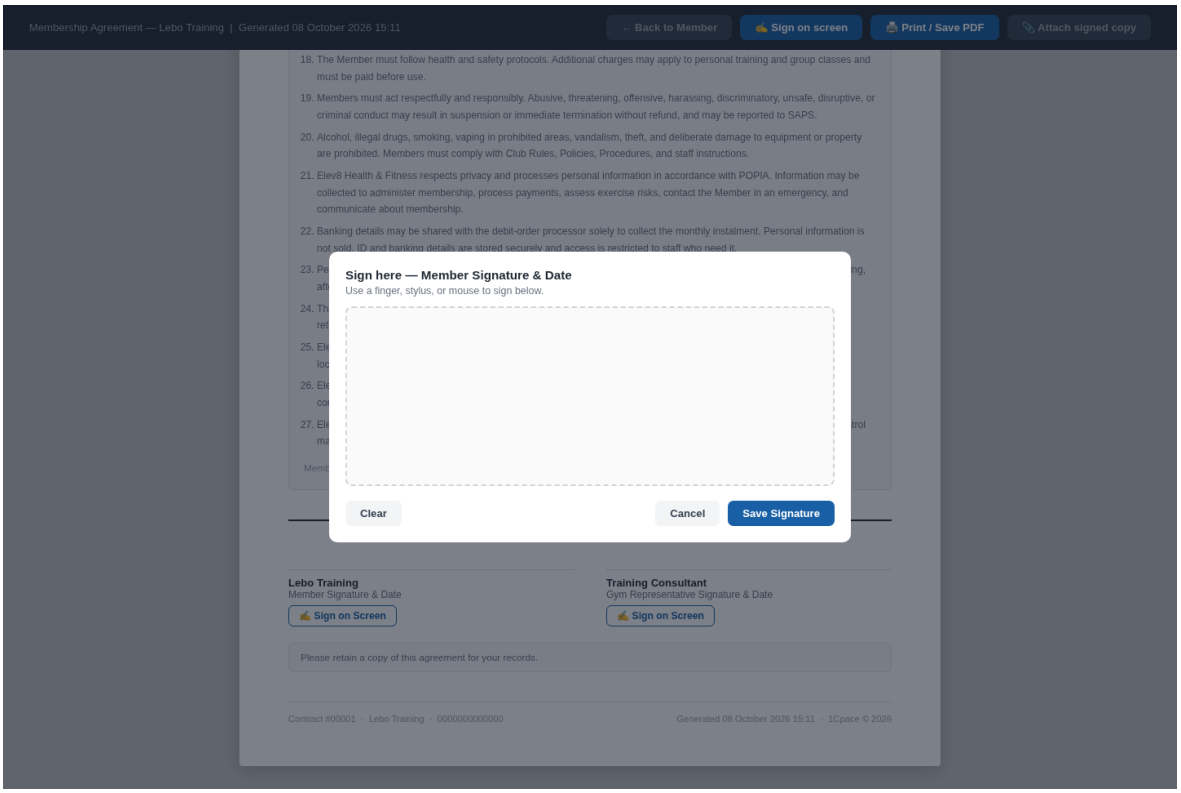

Screenshot 25 — Open the membership contract. Local application; synthetic training example.

1. Use View / Sign Contract on the application.
2. Review the client details and agreement with the client.
3. Scroll to the required signature section.

Expected result: The contract can be read and signed through the app's contract workflow.

Common mistake: Assuming an unsigned uploaded form is a signed contract.

26. Capture the signature

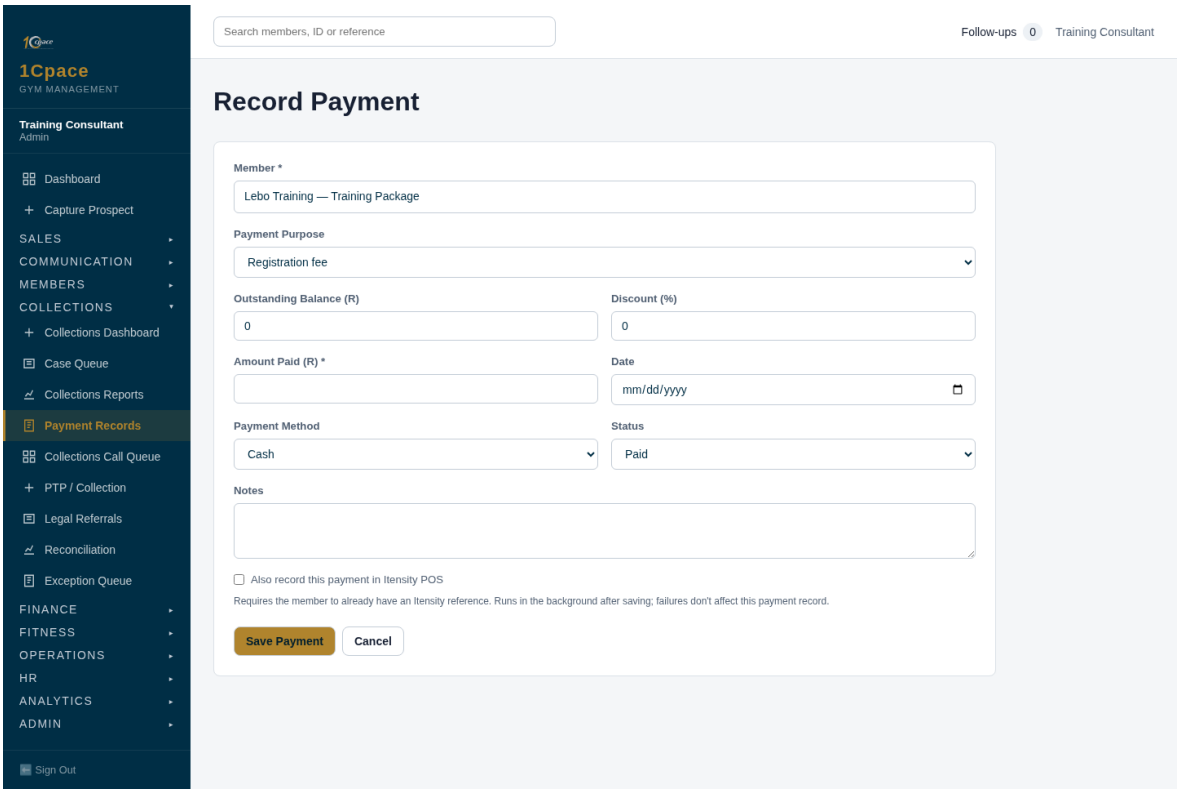

Screenshot 26 — Capture the signature. Local application; synthetic training example.

1. Use Sign on Screen for the required signer.
2. Have the signer sign, then select Save Signature.
3. Check that the signature has been recorded; do not manually fabricate a signed checklist state.

Expected result: The signing workflow supplies contract evidence. It may be completed earlier in the journey.

Common mistake: Saving checklist values without the actual signed-contract evidence.

27. Record the registration fee

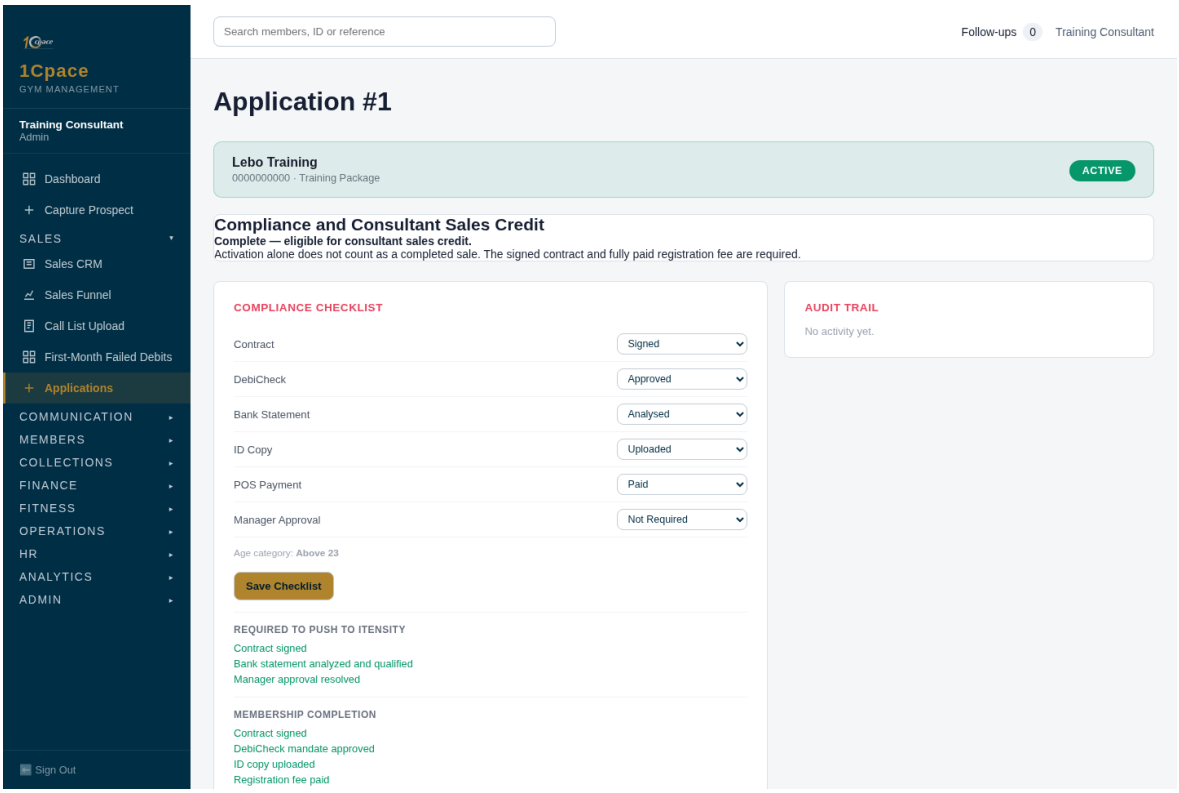

Screenshot 27 — Record the registration fee. Local application; synthetic training example.

1. Use Record Registration Fee Payment from the application.
2. Confirm the correct member and registration-fee purpose.
3. Record the actual payment and ensure the full fee has been paid.

Expected result: Registration-fee payments qualify separately from general collections or monthly fees.

Common mistake: Assuming any paid collection, or a partial registration fee, completes this requirement.

28. Confirm compliance and sales credit

Screenshot 28 — Confirm compliance and sales credit. Local application; synthetic training example.

1. Return to the application after all source workflows are complete.
2. Confirm Complete — eligible for consultant sales credit.
3. Review the monthly sales report using the first compliance-completion date.

Expected result: The consultant receives credit only for a completed sale; the first completion determines the month and is counted once.

Common mistake: Claiming monthly credit while documents, mandate approval, activation, signing, fee or required approvals are still incomplete.

Troubleshooting and final checklist

Issue	What to do
Login	Check spam, use the newest email code, resend if needed, and restart after expiry or exhausted attempts.
Duplicate prospect or member	Open the existing record; do not create another one. Resolve ID warnings before real submission. All-zero IDs and bank details in these pictures are training placeholders.
Document missing or analysis failed	Correct the uploaded evidence and inspect the qualifying result. The application's document panel offers Signed Contract, Bank Statement and SA ID Copy; the broader member profile may offer additional document types.
NuPay rejected or failed	Read the provider response, correct the member/payer/banking information, and use the supported retry action. Submitted or Reviewing is not confirmed approval. Cancelled or inactive mandates should not be treated as approved.
Itensity failed	Inspect the member activity reason, correct it and retry or escalate. Do not repeatedly click while a push is running. Verify the recorded reference after success.

FINAL CHECKLIST

Before claiming a completed sale: confirm the ID and qualifying statement, latest approved DebiCheck, successful Itensity activation, signed-contract evidence, full registration-fee payment and any required guardian/manager approval. Confirm the explicit compliance-complete message.

Detailed Sales practice

This chapter adds the reasoning, checks and handovers behind the 28 screenshot steps in the first part of the manual. Use those screenshots to find the screen, then use this guidance to decide what to record and what to do next. Sales, reception and managers must use their own accounts and assigned permissions.

Start and finish every shift with a work review

1. Select the correct gym and check your signed-in name. If either is wrong, stop before creating or changing a record. Complete the email-code verification and any required password change.
2. Open Notifications and Follow-ups. Separate work due today from work waiting for the client, a provider or a manager. An alert is a request for attention; it is not proof that the underlying task is complete.
3. Review your assigned Sales CRM cards. Read the last activity and the next action before contacting someone. Check for a do-not-contact instruction, an existing appointment or a query that another colleague is handling.
4. Prioritise overdue follow-ups, agreed callbacks and appointments due today. For a blocked application, identify the exact missing evidence instead of starting another application.
5. At the end of the shift, update every case you worked: actual result, clear note, next action, named owner and follow-up date. Hand over unfinished work to the colleague or supervisor responsible for the next action.

Recommended handover note: “Application remains blocked because the uploaded statement did not qualify. Client informed at 14:10. Client will provide a clearer statement on 12 October. Assigned consultant to review that day. Supervisor informed; no submission or activation promised.” Use actual dates and facts, not these example values.

Capture a prospect without creating a duplicate

Search the phone number first, including the existing normalised number where shown. Confirm the name and relevant contact details with the person. A similar name alone does not establish a duplicate, and a different spelling does not justify a second record for the same person.

1. If the prospect already exists, open that record and read its history. If ownership is unclear, ask the responsible manager to resolve the handover. Do not create a second card to take ownership or gain sales credit.
2. Capture the full name, correct phone and email, and the real Original Lead Source. Add the relevant referrer or campaign rather than choosing a source that appears easier to process.
3. Record consent accurately and respect do-not-contact instructions. Avoid putting ID documents or bank details into general prospect notes.
4. Save once and verify who the application assigned. Reception capture of a walk-in is different from consultant capture of a referral, outreach or social lead. Do not assume every capture enters the same rotation.

5. Record what the prospect wants and the agreed next action. A useful note gives the membership interest, availability and contact preference; it does not label the prospect “good” or “bad”.

Example: “Interested in evening training after work. Asked for a call after 17:00 on 12 October to discuss membership options. Consent recorded. No appointment booked yet.” This gives another colleague enough information to continue accurately.

Record calls conversations and appointments correctly

The funnel distinguishes an attempted contact, a conversation, a booked appointment, attendance and an agreement to join. Record what happened at the time of the activity. A long call is not automatically a sale, and a saved appointment is not attendance.

1. Open the assigned prospect and the guided Contact Activity. Confirm the contact method and destination before calling or messaging.
2. When the client answers, explain who you are and why you are contacting them. Confirm the relevant enquiry before discussing details. If the number belongs to someone else, record the outcome and arrange correction without sharing the prospect's information.
3. Choose the actual result. For no response, save the attempted contact and the next supported step. For a callback, enter the specific date/time requested. For an appointment, agree the date/time and record it accurately.
4. After the appointment, record attended or did not attend through Appointment Result. A walk-in is recorded through the walk-in/attendance path rather than invented as a prebooked appointment.
5. Record the consultation decision separately. Agreed to Join means the proposal was accepted; the member still needs the application, evidence and payment/mandate processes.

Do not use a successful-contact outcome to improve totals after an unanswered call. Where a PBX-supported metric is shown, it is separate evidence from the saved contact result. If the call log is missing or appears wrong, report that issue rather than changing the client's outcome to make the report agree.

Work a decision follow-up and close the loop

When the prospect needs time to decide, ask what they still need to consider and agree the next conversation. The app uses a five-working-day decision follow-up rule; read the due action on the card rather than guessing from calendar days. Decision records can be recycled when their applicable period expires.

1. Record the reason for the follow-up in plain language: price question, consultation with a family member, scheduling concern or another stated reason.
2. Enter the agreed follow-up details using the guided action. Check that the date/time saved on the card matches what was agreed.
3. At the next contact, read the earlier note and address the outstanding question. Record the new decision through the relevant action rather than manually forcing a later stage.
4. If the client agrees to join, open the linked application. If they decline, record the actual reason and any contact instruction. If there is no response, record that result and the next permitted step.

5. If you need a manager's decision, record the question, evidence and owner. Keep the prospect informed about what is being reviewed without promising an approval.

Example follow-up question: “At our last discussion you wanted to confirm whether the membership fits your work hours. Have you had a chance to decide, or is there a specific question I should help resolve?” Do not record “joined” merely because the prospect says they will think about it.

Check evidence before submission and activation

The draft, NuPay submission, bank confirmation, Itensity activation and compliance completion are separate checkpoints. A saved draft creates a record for the next steps; it does not perform them. Refer to screenshot steps 12–24 when carrying out the actions below.

1. Check the member's identity, personal details, selected package, monthly amount and intended debit date. Keep the member and a third-party payer clearly identified as separate people.
2. Upload the correct ID copy and bank statement to the correct application. Open the document entry to verify ownership and readability. Correct a wrong upload before analysing or submitting.
3. Run the bank-statement analysis and read the qualification result, not only the balance or risk label. The original manual's qualification rule remains subject to the actual analysis result. A failed or unreadable analysis needs correction or review; uploading a PDF alone does not qualify it.
4. Resolve any required manager/guardian approval through its own workflow. Ordinary staff and manager approval do not remove a missing-document or mandate-confirmation gate. An admin override is an explicit, audited exception, never a routine workaround.
5. Prepare and submit the mandate through the supported action. Client Reference 1 uses the member ID; an Itensity reference is not required first. Recheck third-party payer identity and banking details without replacing the member ID reference.
6. Confirm approval for the latest mandate before the ordinary Itensity push. If a newer mandate is unapproved, an older approved mandate does not satisfy the current requirement.
7. Push once, wait for the result and verify the stored reference. If the result is uncertain, inspect the activity/provider result and ask for assistance before retrying. Repeated clicks can create avoidable reconciliation work.

Complete the sale and hand the member over

An Active label confirms a different milestone from compliance completion. An activated member can still have an unsigned contract, unpaid registration fee or another requirement outstanding. Read Compliance and Consultant Sales Credit on the application.

1. Review the contract with the member and capture the actual signature through the signing workflow. Do not substitute a manually selected checklist status for signature evidence.
2. Record the registration-fee payment under the correct purpose. Match the amount and reference to the actual receipt. A monthly payment or general collection does not replace the fee; a partial fee does not complete a requirement for full payment.

3. Reopen the application and confirm the explicit compliance-complete message. Check documents, qualifying analysis, latest approved mandate, successful activation, signature, full fee and required approvals.
4. Check the member profile and recorded Itensity reference. Explain the agreed membership amount, debit date and where to direct a payment or account question. Do not change banking information to make a handover appear complete.
5. Review the sales report using the first compliance-completion date. The month of that completion determines sales credit and the completed sale is counted once.
6. If the first debit later fails, follow the assigned first-month collections work instead of reopening or claiming another sale. A collection payment and a new sale are separate outcomes.

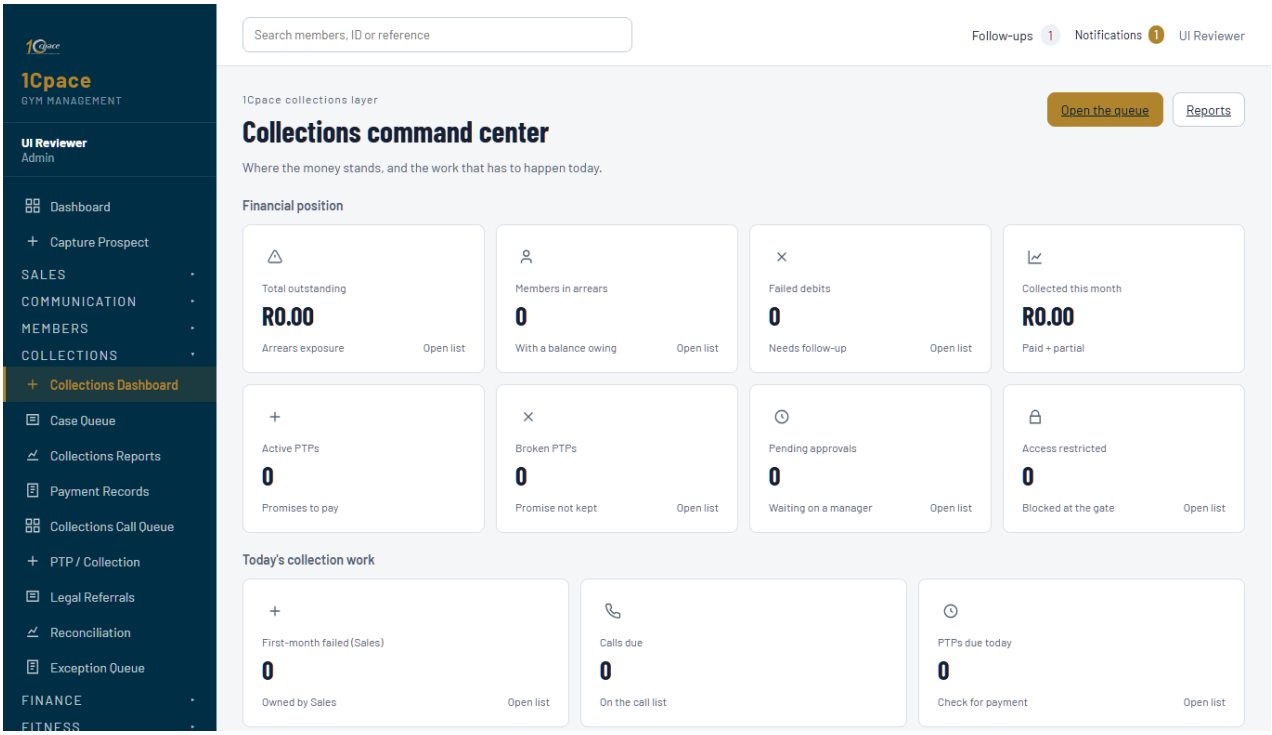

Before leaving the member's record, ask: “Can the next colleague identify what is complete, what is outstanding, who owns the next action and when it is due?” If the answer is no, improve the note and assignment before handover.

Collections

Collections is the workflow for checking money owed, recording contact and recovering verified arrears. A client saying they paid, a receipt upload, a PTP and a mandate approval are each different from a reconciled payment. Use the member's current account, not memory or a dashboard total, to establish the case.

Open the dashboard and choose the right work

Open the Collections dashboard using your assigned permissions. Sales staff may have first-month work while reception handles transferred or older accounts. Read the owner, arrears and next action on the case. If an account is assigned to another person, resolve the handover instead of creating parallel contact.

Collections dashboard from the local training app using synthetic records

1. Review the work categories, due calls and pending decisions. A pending exception needs a manager decision, while a call task needs the assigned caller to record an actual contact result.
2. Open the appropriate queue or member case. Check the member reference and contact details before discussing an account.
3. Check the applicable debit cycle and the reconciliation result. A pending debit is not a confirmed failure. Reminder messaging and a collection call are separate records.
4. Read the latest payment, mandate, PTP, dispute and contact history. This prevents chasing a payment already received or making an offer that conflicts with a live arrangement.
5. If the balance or ownership appears wrong, stop that decision and record the issue for review. Do not alter a payment or promise merely to remove the account from a list.

Verify the balance before contacting the member

1. Identify the recurring charges, failed debit results, verified payments and any reversals. Separate the current month's membership fee from older arrears, registration fees and any other payment purpose.
2. Confirm the months owing and the source of the displayed balance. If a provider import or reconciliation is outstanding, describe it as outstanding rather than calling the amount final.
3. Check whether there is an active PTP and whether the latest DebiCheck mandate is confirmed. Read the access decision separately; a saved promise does not establish a payment or entitlement to access.
4. Where the client claims an earlier payment, obtain the amount, date, method, reference and proof through the approved document/receipt workflow. Record "client says already paid" until the payment has been verified.
5. Log a dispute or mismatch as a Query, with the account details and question to be checked. Assign the person responsible for reconciling it and set the follow-up date.

Suggested opening: "I am following up on your membership account. Our current record shows an outstanding amount of R____. Before we discuss a payment arrangement, have you made a payment we need to verify or is there an amount you would like us to check?" Only fill in the amount after reviewing the account.

Complete a collection call and record the outcome

1. Open the assigned call task or member case and use the permitted calling action. Check the destination and read the last note so the client does not have to repeat the same issue.
2. Establish whether you reached the member. An unanswered call, wrong number or disconnected number must use its actual outcome.
3. If the member answers, discuss the verified account and select the result that matches the conversation: a delivered reminder, reactivation interest, promise to pay, callback, already-paid claim, dispute or refusal, as shown on the screen.
4. Answer any follow-up question shown for that outcome. An already-paid claim needs the payment purpose. A dispute needs the disputed amount/type. A refusal needs the reason. "Other" needs a useful written explanation.
5. Enter the next date/time for an agreed callback or payment action. A promise needs a formal PTP where applicable; a note saying "will pay" does not replace it.
6. Save and read the recorded result. Check that the next action and any linked Query/PTP have actually been created. If the action failed, correct it or escalate rather than assuming the note performed it.

Example note: "Reached member. Disputes the monthly amount, not the identity of the account. Query logged for package/amount verification. No discount offered. Assigned reviewer to confirm by 12 October; caller to update member after review."

Follow the communication sequence and measure honestly

The collection workflow follows Call → WhatsApp → SMS → Email where those steps are applicable. The screen tracks what was actually sent or attempted. Do not mark a message sent merely because a template was prepared, copied or a channel selected.

1. Check the next channel on the case and confirm the approved contact details and message before sending.
2. Use only an available, authorised sending method. WhatsApp/SMS steps may require manual handling; an unavailable provider is an issue to report, not evidence of delivery.
3. Record the real sent/failed result and any reply. Preserve the earlier call history. A client reply that changes the case must also update the business outcome or follow-up.
4. Use the final email action only when the prior required communication steps have been recorded. If sending fails, keep the case open and report the failure.
5. Review Calls, Clients Reached and PBX Verified Calls as separate measures. Saved successful-contact outcomes support Clients Reached; the PBX-confirmed figure applies its own evidence requirement. A reminder message is not a completed collection call.

The current queue uses an 80-call minimum, a 100-call target and a 10-contact target for its daily KPI. Check the live screen and your assigned duties before interpreting a target. Never manufacture outcomes to meet it. Review overdue cases and unresolved disputes alongside activity totals.

Record payment and resolve or escalate the case

1. Record only an actual received payment, against the right member and purpose. Check the amount, payment date, method and reference against the receipt or verified provider result.
2. Before saving, search for an existing payment with the same details. A client resending a receipt is not a new payment. If an import may already have posted it, reconcile first.
3. Record and verify the receipt/payment using the supported workflow. If a payment push is required, wait for its result and confirm the external reference instead of assuming the local save succeeded outside the app.
4. Recheck the remaining balance, PTP instalments and case status after the payment. A partial payment reduces only the amount verified; it does not settle the whole account.
5. If the case is settled, confirm the reconciliation and supported closure. If it is not settled, agree and record the next action without deleting the history.
6. Escalate non-standard discounts, disputed calculations, prior defaults, legal-pathway cases, unclear provider results or access exceptions to the authorised reviewer. Include the verified account, what the member requested, the evidence and the decision needed.

If the member disputes the charge or requests cancellation, use the relevant Query/approval process. A collections caller must not silently write off arrears, approve a cancellation or grant an exception simply to finish a call.

Promise to Pay

A Promise to Pay or PTP is a recorded agreement about future payment. It is not a receipt, a discount approval, a successful debit or confirmation that the account is settled. The arrangement must remain linked to its actual payments, dates and required approvals.

Prepare the arrangement with the member

1. Open the member's account and review the verified arrears, normal monthly membership amount, latest mandate, existing arrangement and relevant Query.
2. Ask what the member can actually pay and on which dates. Record the stated offer accurately. Do not record an offered upfront amount as money already received.
3. Select the appropriate full/split/recovery arrangement shown by the app. Check that each promised amount and date is realistic for the member and distinct from the normal membership fee.
4. Read the calculated discount, upfront, balance and recovery figures and the required conditions. Different panels serve different decisions; do not apply one fixed upfront percentage to every offer or bypass a displayed access/payment requirement.
5. If manager review is required, explain that the proposal is pending approval. Do not describe it as accepted or apply the proposed reduction as a verified payment.
6. If a related Query already exists, create/link the PTP through that case where the screen offers it. This keeps the issue and the financial arrangement connected without creating duplicate records.

Enter the PTP and read the saved result

Find the PTP section on the member profile or use Create PTP from the linked Query when available. Access to the financial arrangement may be restricted by role. If you cannot see the action, hand it to authorised reception/collections staff rather than borrowing their login.

1. Confirm the member, arrears amount, promise amount, promise date and payment method. Enter the actual agreed values, not a rounded figure that changes the agreement.
2. Choose the arrangement type. Where instalments are used, confirm each amount and due date and check the final total.
3. Review the requested discount and its qualifying basis. Read the system's permitted range, recommended figure and manager requirement. A discount above the staff ceiling, or an account marked for manager discretion, needs the authorised decision.
4. Review any upfront amount and access request. If the screen requires proof of an upfront payment or a confirmed mandate, obtain the evidence rather than marking a promised amount received.
5. Write the agreement clearly: what will be paid, when, by which method, what remains payable, and which approval/condition is outstanding. Include the linked Query reference where applicable.
6. Save once. Reopen the arrangement and check its status, calculation and approval requirement. The app can supersede an older open PTP when a new one is recorded; review the history before creating another.

7. Explain the saved agreement to the member. Give the amounts and dates separately from the normal monthly membership payment. Do not promise that a pending arrangement has already restored access.

Understand approval access and exceptions

The app determines approval and access using the account's arrears, arrangement, confirmed mandate and verified payment conditions. Read its actual decision. The number of months owing by itself is not enough to decide whether an arrangement or discount is available.

1. If Manager Approval is pending, send the proposal and evidence to the assigned reviewer. Include previous broken arrangements or a legal referral where present.
2. The reviewer must record approve/reject/return through the decision workflow and include the reason. A verbal agreement outside the app must be entered through that supported workflow before staff rely on it.
3. If returned for correction, correct the stated issue and record the next follow-up. If rejected, inform the member of the decision and discuss only the options actually permitted.
4. Read the account's access decision after the approved/verified actions. Temporary access, where authorised, has an expiry and conditions; record the expiry accurately and explain it without guaranteeing an indefinite unblock.
5. Do not use a PTP as a way to remove a restriction without the required condition. When policy and the displayed result appear inconsistent, escalate the discrepancy instead of manually changing labels.

Managers should review the complete account before approving a hardship or non-standard arrangement. Staff should never guess a legal outcome, promise a write-off or approve their own request.

Work through a calculation without confusing the amounts

Arithmetic example only: assume a reviewer has already approved a R1,200 arrears balance and a 20% reduction for this particular case. This example does not authorise that discount for another account.

Item	Calculation	Amount
Verified arrears	Starting amount	R1,200.00
Approved reduction	R1,200 × 20%	R240.00
Amount to collect	R1,200 − R240	R960.00
Verified upfront receipt	Actually received	R300.00
Remaining arrears	R960 − R300	R660.00
Three equal arrears instalments	R660 ÷ 3	R220.00 each

If the normal monthly membership amount is R345, the member would need to understand the R220 arrears instalment separately from that R345 amount. The combined R565 is an arithmetic explanation, not a mandate instruction: use the approved plan and the debit amounts actually saved by the system.

If R300 has only been promised, do not subtract it as a verified receipt. If a discount is still proposed, explain the proposed and approved amounts separately. If the app calculates a different plan because of its term, minimum or other rule, follow that displayed plan and ask for review before offering different figures.

Record receipts and monitor a missed promise

1. On the promised date, check actual receipts/provider results and the linked account. A member saying the bank will debit tomorrow is not a payment received today.
2. Record the payment once with amount, date, method, reference and supporting evidence. Allocate it to the correct arrangement/instalment using the supported receipt action.
3. Read the remaining amount and status. A partial receipt does not turn the arrangement into Paid. Do not manually force Paid to clear an overdue alert.
4. If the promise date passes without the required payment, review the actual balance and overdue/broken result. Automation can update the arrangement and access state; verify the current record before contacting the member.
5. Contact the member, record the actual result and agree the next authorised action. A revised offer may need manager review, especially where there is a prior default or other exception.
6. Update the linked Query. A paid PTP can produce a payment-verified query state, but the Query may still need a resolution note and supported closure. Do not assume every issue is resolved simply because one instalment was received.

Supervisor review should ask whether the receipt was verified, the allocation is correct, the remaining balance is clear and the next action is assigned. Preserve the old arrangement history so repeated defaults can be assessed accurately.

DebiCheck and NuPay

DebiCheck is the mandate approval workflow used here through NuPay. A mandate records the payment instruction and its confirmed state. Saving it, submitting it, getting approval and receiving a payment are four separate events. Use the screenshot sequence in steps 18–21 alongside this guide.

Choose the correct member payer and mandate

1. Open the member/application and identify the latest relevant mandate. Read existing references and statuses before creating a new one. Do not duplicate an instruction merely because an earlier response is taking time.
2. Confirm the member ID and, where someone else pays, the third-party payer's identity and relationship. Enter banking information in the secured fields, not in a general contact note or staff message.
3. Confirm the account holder, bank, account number/type, instalment and debit date against the client's supplied information. Read back the relevant amounts and timing without exposing the full account number to other people.
4. Confirm that required ID/document evidence and a qualifying bank analysis exist. If blocked, correct the evidence or refer the issue through the appropriate review path.
5. Keep Client Reference 1 as the member ID in this app's submission path. Keep the provider mandate ID and later Itensity reference in their own fields.
6. Check which action you are about to use. Save Mandate stores the data; Submit & Push to NuPay sends it when the prerequisites pass. Read the result after the action.

Interpret status and follow up with the member

What you see	What it establishes	Required next check
Saved or draft	A local mandate record exists	Check values and submission prerequisites
Submitted or reviewing	The instruction has been submitted or is awaiting a result	Obtain the supported provider/bank status
Confirmed approved or active	The returned result satisfies the current mandate approval check	Verify that it is the latest relevant mandate
Rejected failed cancelled or inactive	The instruction is not a current confirmed approval	Read the response and obtain correction/review

1. After submission, tell the member to follow their bank's authorisation instructions. Do not ask for their banking password, PIN or one-time authorisation code.

2. Use Check NuPay Status where the app offers it and read the returned result. Do not substitute a manual Approved selection for provider confirmation.
3. If approval is still pending, record that state and an agreed follow-up. Do not promise activation while the ordinary activation gate remains blocked.
4. If rejected/failed, identify the stated reason, confirm the details with the member and use the supported correction/retry process. If the cause is unclear, escalate it before another submission.
5. Once confirmed, check the application checklist and latest mandate. An old approval is not evidence that a later amended mandate has been approved.

Handle a failed debit or a change in banking details

An approved mandate does not prove that each debit succeeded. Collections must use actual transaction results and the reconciled balance. For a failed debit, record the verified result and follow the Collections/PTP process; do not call the mandate itself paid.

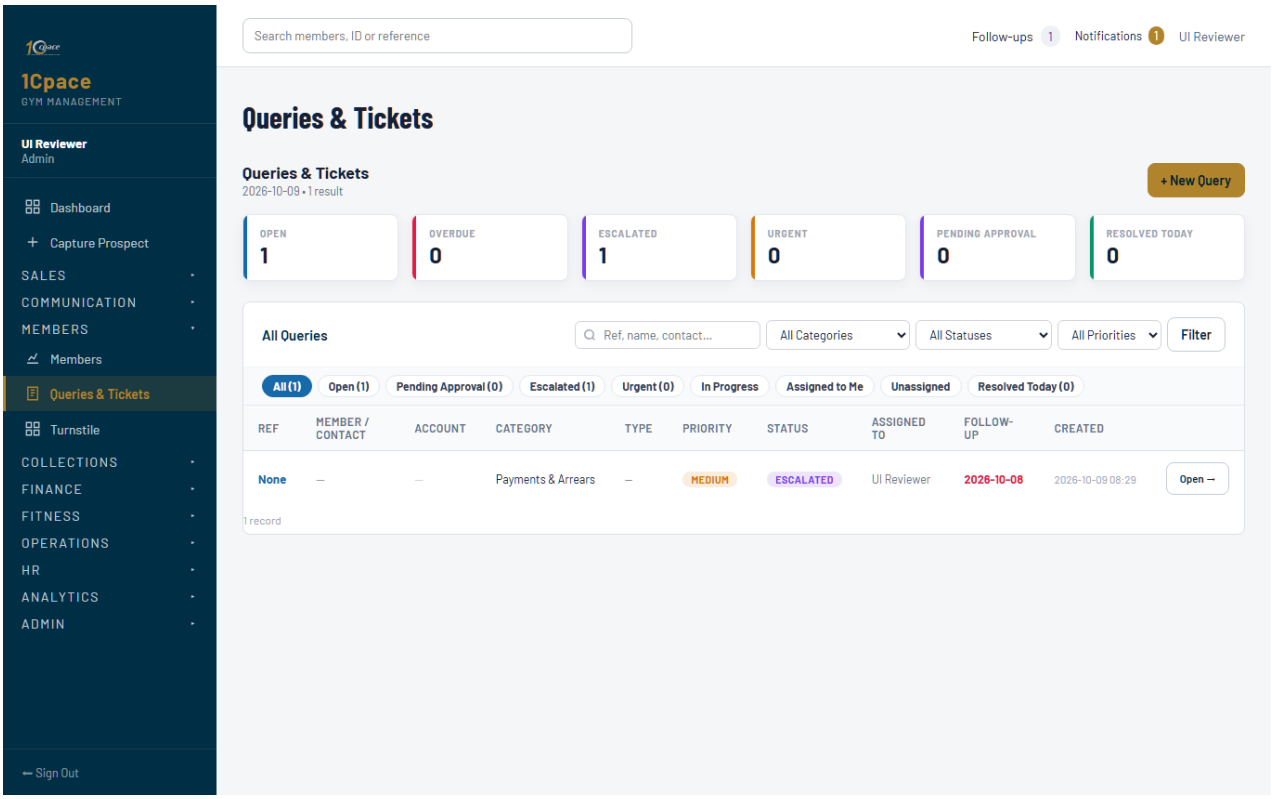

1. Check whether the issue is the instruction, the bank's authorisation or an individual payment result. Record the actual reference and relevant response.
2. When the member requests a change, confirm their identity and the intended change using the supported process. Do not overwrite the old banking values in general notes or assume the old approval applies to the new instruction.
3. Obtain a new/amended confirmed mandate where required by the available workflow. If the app does not support the requested amendment, refer it to the authorised administrator/provider process.
4. Check that an old instruction will not cause an unintended duplicate collection before proceeding. Escalate unclear cancellation/replacement status rather than guessing.
5. Record the next owner and date and inform the member of what is confirmed and what remains pending. Keep transaction recovery separate from mandate maintenance.

When a provider action is unavailable or fails, keep the record pending and escalate the operational issue. A staff notification, a screenshot or a saved checklist is not confirmation that NuPay, the bank or Itensity performed the action.

Queries

A Query is the case record for an issue needing investigation, a decision or follow-up. It captures why action is needed, who owns it and when it must be followed up. A linked PTP records the financial arrangement; the Query records the issue and its resolution.

Log the issue and assign an owner

Queries workspace from the local training app using synthetic records

1. Search the member and existing open Queries first. If the same issue is already being handled, add the update to that record rather than creating a duplicate case.
2. Open the new Query action and select the correct member, category and query type. For a payment dispute, identify exactly what is disputed: balance, amount, payment allocation or another issue.
3. Describe the client's request and the facts separately. “Client says a R500 EFT was made on 8 October; reference supplied; payment not yet matched” is clearer than “account wrong”.
4. Set a suitable priority, department, named assigned person and follow-up date. The normal new-query follow-up window is five working days unless another date is recorded; urgent cases should not be left on an ordinary default date.
5. Save and record the Query reference. Verify the member link and the actual owner. A department name alone does not identify the employee who must act.
6. Tell the member what will be checked and when they can expect an update. Record that communication and next action without promising an outcome that still requires review.

Query notes should contain enough information to investigate the issue, but should not repeat full banking credentials or attach unrelated private documents. Use the supported document/evidence workflow for sensitive material.

Investigate and use status to show the real position

Status	Meaning for the staff member	What must still happen
Open	Issue captured and awaiting work	Review and begin the assigned action
In Progress	An owner is working the issue	Record findings and the next action
Pending Member	The member must supply information/action	Record what is needed and the follow-up date
Pending Admin	An administrative action is outstanding	Assign the responsible person and due date
Pending Approval	A controlled decision is required	Authorised reviewer must approve/reject/return
Escalated	Management help has been requested	Reviewer acts; the case remains open
Resolved	The issue has been addressed	Preserve evidence and confirm the supported closure
Closed	The supported closing action is complete	Keep the history for later reference

1. Read the latest note, account summary, linked arrangement and previous decision. Check the verified balance before considering a financial request.
2. Record each material finding: what was checked, which result was confirmed and what remains uncertain. Do not remove an earlier dispute note after correcting the account.
3. Update Action Taken and the next follow-up using the supported form. A status without a useful note gives the next colleague no instruction.
4. For payment cases, use the specific stages shown, such as Arrears Confirmed, PTP Created, Awaiting Payment, POP Received and Payment Verified. POP Received means evidence was supplied; verification is a separate action.
5. If nothing has changed by the agreed date, update the member and record the new owner/date or escalate the delay. Do not repeatedly move the date with no explanation.

Escalate clearly and request a controlled approval

Escalation requests assistance; approval authorises a specific controlled decision. They are related but not interchangeable. A manager seeing an alert does not automatically approve a discount, cancellation or other request.

1. On the Query, select Escalate when management assistance is needed. Enter a specific reason: what cannot be resolved, what has already been checked, the member's request and the decision needed.
2. Confirm Escalate and read the updated case. The app routes the escalation to Management, raises priority and puts it on the due follow-up list. The recorded owner and their own configured supervisor receive separate notifications.
3. Where a financial/cancellation decision requires approval, use the request-approval workflow. Enter the proposal, reason and supporting facts instead of treating the escalation note as an approval.
4. The authorised reviewer checks the account and evidence, then records the supported decision. Staff must not approve their own request or bypass a pending approval to close the case.
5. After the decision, the assigned person informs the member and carries out the permitted next action. Record what was approved, what was declined or what needs correction.

Recommended escalation note: “Member disputes three recurring charges after a package change. Compared the account and payment references; no duplicate payment found. Need manager/admin confirmation of the applicable package amount before proposing an arrangement. Member promised an update on 12 October. No balance reduction applied.”

Link a PTP and close the Query with evidence

1. If the issue requires a payment arrangement, confirm the member and approval state. Use Create PTP from the Query when available rather than creating an unrelated arrangement.
2. Read the carried-through account values and enter the actual agreed plan. Confirm the linked PTP reference after saving. Do not create a second open arrangement while a linked one is still live unless the supported replacement process applies.
3. Track the arrangement's outcome through payments and the linked Query. A broken promise needs follow-up; a payment-verified event may still leave another part of the Query unresolved.
4. Before closure, check that the required approval is decided and that there is no unresolved linked financial arrangement preventing closure. For an owing cancellation/freeze case, follow the displayed balance and acknowledgment requirements.
5. Use Close Query with the proper closure reason and resolution notes. Explain the completed action, evidence/reference, member communication and any separately assigned follow-up.
6. Save and verify the closed record. If the app blocks closure, resolve the stated condition rather than manually changing a status selection.

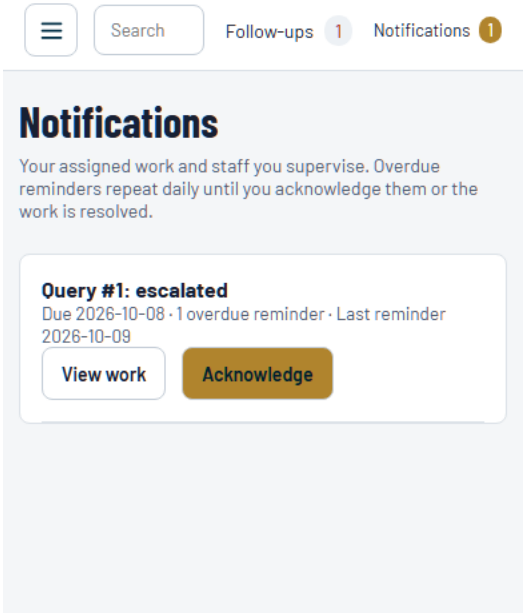

Example closure note: “Payment matched to the correct member and recurring-fee period. Duplicate claim checked; no second receipt entered. Corrected account allocation verified. Member informed on 12 October. Linked arrangement settled; no approval remains pending.” Use this wording only when each statement is true.

Notifications supervision and daily handover

Notifications support follow-up across Sales, reception and approval/escalation work. They are internal app alerts, not automatic WhatsApp, SMS or email messages to staff or members. The assigned employee and their own supervisor receive separate alerts rather than broadcasting every case to the department.

Set up the supervisor and work the alert

An administrator must select each employee's Supervisor under Admin → Users → Edit. The supervisor must be an active staff account in the same gym. Self-assignment and reporting cycles are rejected. If your Notifications page says no supervisor is assigned, ask the administrator to correct the relationship.

Notification with an overdue reminder in the local training app using a synthetic Query

1. Open Notifications at the start of the shift and return to it during the day. The top-bar count refreshes while the page is visible; background checking also runs without staff opening the page.
2. Read the source, due date and reminder information. Use View work where permitted to inspect the actual case. A supervisor alert does not grant new permissions to approve or edit a restricted record.
3. Acknowledge only when you have taken responsibility for reviewing the alert. Opening it does not acknowledge it automatically. Each recipient acknowledges their own copy.
4. Carry out the next action in the underlying Query, Sales activity, application or arrangement. Acknowledgment stops your alert reminders, but does not close the case, receive money or approve a request.
5. Record the result, owner and follow-up date in the source workflow. When the source is resolved/completed/decided, its active alert is retired.

Once overdue, a recipient receives one recorded reminder per Johannesburg calendar day until they acknowledge it or the work is resolved. A new escalation or approval request creates a fresh alert even when an earlier one was acknowledged. Changes in assignment or supervisor retire the previous recipient's alert.

Keep acknowledged work from being forgotten

Acknowledged work can remain unfinished. Continue using the source's follow-up date and team review until the actual issue is resolved. Notifications are a prompt to act; the source case is the record of work.

1. The assigned person updates the case, not merely the alert. If waiting for someone else, record who, what is needed and the date of the next check.
2. The supervisor reviews overdue and pending decisions, confirms that a named person owns each action, and requests a clear update when a case has not progressed.
3. If the assigned employee changes, record the supported reassignment. Do not assume a direct staff message has transferred responsibility in the underlying case.
4. Include outstanding approvals, unresolved payment claims, missed promises and provider failures in shift handover. Give the record reference, current state and next required action.
5. If there is no assigned employee, use the source workflow to assign one. Some alerts fall back to the recorded creator/requester; a case with neither has no individual employee recipient. Review unassigned work in the manager queues rather than relying only on alert counts.

Handover format: record reference; verified position; action already taken; decision/evidence still required; next owner; follow-up date; member update due. Do not include passwords, PINs, one-time bank codes or full bank credentials in the handover.

Practice assessment and daily checklist

Use synthetic records or a supervisor-led discussion for training. Do not practise by submitting a real mandate, posting a payment, changing a live member's access or pushing to Itensity. The trainer should confirm both the screen action and the explanation of its result.

Practise the full handover with five cases

Practice case	What the trainee must demonstrate	Evidence the trainer checks
Sales client agrees to join	Capture the decision and linked application without claiming activation/completion	Separate commitment, activation and compliance milestones
NuPay is submitted but approval is pending	Explain the pending state and record a follow-up	No fabricated approval or ordinary activation
Member says an EFT was already paid	Record the claim and investigation before posting another payment	Amount/date/reference and Query ownership
PTP misses its promise date	Review receipts and status, then record contact and next action	Verified balance, real outcome and required review
Query needs management help	Enter the reason, owner and due action, then distinguish acknowledgment from resolution	Escalation history, separate recipients and source task still open

Ask the trainee to explain why each wrong shortcut would mislead the next colleague. A successful demonstration includes the correct record, actual outcome, useful note, named owner, due date and required evidence—not just a sequence of clicks.

Daily operating checklist

- Confirm the gym, signed-in employee and own assigned permissions.
- Check Notifications, due Follow-ups, appointments and assigned collection tasks.
- Read the existing record and history before contacting the client or creating another case.
- Record actual contact, attendance, decisions and payment results without changing them to improve totals.
- Verify document ownership, qualification, latest mandate result and any required approval before a controlled submission or activation.
- Separate a proposed arrangement, approved arrangement, supplied proof and verified receipt.

- Keep the ordinary monthly fee, arrears, registration fee and any other purpose separate.
- Give every unfinished action a named owner and follow-up date, with a useful note.
- Escalate a blocked decision with evidence and a clear request; acknowledgment does not finish the task.
- Before handover, confirm what is complete, what is outstanding and who must act next.

The trainer should repeat the exercise after a workflow or approved gym policy changes. This edition expands the original Sales screenshot guide and adds operational guidance checked against the application workflows available on 9 October 2026.
